

DESCRIPTION

This fully-assembled pan-tilt kit is the perfect way to give your project full range motion with two micro servos. The pan-tilt can rotate roughly 180° from side-to-side and can tilt up&downwards around 150°. It also comes fully assembled with two Micro Servos (https://www.adafruit.com/products/169) (SG-90 or SG-92 type) included and a 38mm x 36mm space to mount a camera or sensor or whatever you like.

Since the motors are plain, every-day analog servos, you can use any microcontroller or driver. They're good for beginners who want to make stuff move and the pan-tilt is an easy way to give whatever you're making both left-right and up-down motion. In our demo, we hooked this up with a Trinket Pro (https://www.adafruit.com/product/2000) and made it do a little dance with the Arduino Servo library (http://arduino.cc/en/reference/servo)
