## Data Sheet

## Description

The ADBS-A350 sensor is a small form factor (SFF) LED illuminated optical finger navigation system. It is a lowpower optical finger navigation sensor with low-power architecture and automatic power management modes, making it ideal for battery-and power-sensitive applications such as mobile phones.

The ADBS-A350 is capable of high-speed motion detection - up to 20 ips. In addition, it has an on-chip oscillator and integrated LED to minimize external components.
There are no moving parts, thus provide high reliability and less maintenance for the end user. In addition, precision optical alignment is not required, facilitating high volume assembly.
The sensor is programmed via registers through either a serial peripheral interface or a two wire interface port. It is packaged in a 28 I/O surface mountable package.
The ADBS-A350 is designed for use with ADBL-A321 lens.
The ADBL-A321 lens is the optical component necessary for proper operation of the sensor.

## Theory of Operation

The ADBS-A350 is based on Optical Finger Navigation (OFN) Technology, which measures changes in position by optically acquiring sequential surface images (frames) and mathematically determining the direction and magnitude of movement.

The ADBS-A350 contains an Image Acquisition System (IAS), a Digital Signal Processor (DSP), and a communication system.
The IAS acquires microscopic surface images via the lens and illumination system. These images are processed by the DSP to determine the direction and distance of motion. The DSP calculates the $\Delta x$ and $\Delta y$ relative displacement values.
The host reads the $\Delta x$ and $\Delta y$ information from the sensor serial port if a motion interrupt is published. The microcontroller then translates the data into cursor navigation, rocker switch, scrolling or other system dependent navigation data.

## Features

- Low power architecture
- Surface mount technology (SMT) device
- Self-adjusting power-saving modes for longer battery life
- High speed motion detection up to 20 ips
- Self-adjusting frame rate for optimum performance
- Motion detect interrupt
- Finger detect interrupt
- Soft click and Tap detect interrupt
- Single Interrupt pin
- Optional PWM output for LED illumination
- Optional switch input for center click function
- Internal oscillator - no clock input needed
- Selectable 125, 250, 500, 750, 1000 and 1250 cpi resolution
- Single 1.8 V supply voltage for analog and digital
- Internal power up reset (POR)
- Selectable Input/Output voltage at 1.8 V or 2.8 V nominal
- 4-wire Serial peripheral interface (SPI) or Two-wire interface (TWI)
- Integrated chip-on-board LED with wavelength of 870 nm

## Applications

- Finger input devices
- Mobile devices
- Integrated input devices
- Battery-powered input device

Avago customers purchasing the ADBS-350 OFN product are eligible to receive a royalty free license to our US patents 6977645, 6621483, 6950094, 6172354 and 7289649 , for use in their end products.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## Pinout of ADBS-A350 Optical Sensor

| Pin | Name | Description | Input/Output pin | Function |
| :---: | :---: | :---: | :---: | :---: |
| 1 | GND | Ground |  |  |
| 2 | XY_LED | XY LED driver connection |  | Must connect to LED(see schematics Figure 7a, 7b) |
| 3 | EVENT_INT | Event Interrupt (active low output) | O (CMOS output) | Open when not used Default active low signal, can be changed in Event control register 0x1d |
| 4 | GPIO | General Purpose Input/ Output | I (Schmitt trigger input)/ <br> O (CMOS output) | Pin can be used for FPD output, PWM output or Dome/ Button click input. If configure as input do not leave pin unconnected |
| 5 | VDDIO | Voltage supply for Input/ Output pins |  | Supply 1.8 V or 2.8 V |
| 6 | IO_MOSI_A0 | TWI address set or Master Out Slave In | I (Schmitt trigger input) | SPI : MOSI (Master Out Slave In) signal TWI Address Select, AO <br> Do no leave pin unconnected |
| 7 | IO_CLK | Serial clock input | I (Schmitt trigger input) | Serial clock signal |
| 8 | IO_MISO_SDA | TWI serial data or Master In Slave Out | In SPI - CMOS output. <br> In TWI - open drain I/O | SPI : MISO (Master Input Slave Out) signal TWI : serial data signal |
| 9 | IO_NCS_A1 | TWI address set or Chip Select | I (Schmitt trigger input) | SPI : NCS (chip select) active low signal TWI Address Select, A1 Do no leave pin unconnected |
| 10 | NRST | Hardware Chip Reset | I (Schmitt trigger input) | Set to high when not used Active low signal |
| 11 | GND | Ground |  |  |
| 12 | NC | No Connect |  | No connection |
| 13 | SHTDWN | Shutdown (active high input) | I (Schmitt trigger input) | Set to low when not used Active high signal |
| 14 | VDDIO | Voltage supply for I/O |  | Sets I/O voltage |
| 15 | IO_SELECT | SPI / TWI Select | I (Schmitt trigger input) | TWI : GND or SPI : High |
| 16 | NC | No Connect |  | No connection |
| 17 | NC | No Connect |  | No connection |
| 18 | NC | No Connect |  | No connection |
| 19 | NC | No Connect |  | No connection |
| 20 | VDD | Voltage supply |  | Supply 1.8 V |
| 21 | GND | Ground |  |  |
| 22 | GND | Ground |  |  |
| 23 | NC | No Connect |  | No connection |
| 24 | LED- | LED Cathode |  | Must connect to XY_LED |
| 25 | LED- | LED Cathode |  | Must connect to XY_LED |
| 26 | LED- | LED Cathode |  | Must connect to XY_LED |
| 27 | LED+ | LED Anode |  | Provide 1.8 V supply voltage |
| 28 | GND | Ground |  |  |

Note:

1. NC pins can be tied to VDD, GND or left open/ unconnected.

Note:
X350 = A350
XYYWWZ, where $Y Y$ = last 2 digits of year, $W W$ = work week

Figure 2. Package outline drawing

## Overview of Optical Sensor Assembly

Avago Technologies provides an IGES file drawing describing the cover plate molding features.

The components interlock as they are mounted onto defined features on the cover plate.

The ADBS-A350 sensor is designed for surface mounting on a PCB, looking up. There is an aperture stop and features on the package that align to the lens.

The lens provides optics for the imaging of the surface as well as illumination of the surface at the optimum angle. Features on the lens align it to the sensor and cover plate. Contamination must be kept away from the lens. During assembly process, it is recommended to use a minimum of a 10 K clean room environment or equivalent laminar flow workbench.

## PCB Assembly Considerations

1. Surface mount the sensor and all other electrical components into PCB.
2. Reflow the entire assembly in a no-wash solder process.
3. Remove the protective kapton tape from optical aperture of the sensor and LED. Care must be taken to keep contaminants from entering the aperture. Recommend not to place the PCB facing up during the entire assembly process. Recommend to hold the PCB first vertically for the kapton removal process.
4. Press fit the lens onto the sensor until there is no gap between the lens and sensor, with force up to maximum 2.2 kgf. Care must be taken to avoid contaminating or staining the lens. The lens piece has alignment posts which will mate with the alignment holes on the sensor package.
5. Place and secure the optical navigation cover onto the lens to ensure the sensor and lens components are always interlocked to the correct vertical height. The cover design has a foolproof feature to avoid wrong orientation of the cover.
6. The optical position reference for the PCB is set by the navigation cover and lens.
7. Install device top casing. There MUST be a feature in either top casing or bottom casing to press onto the sensor to ensure the sensor and lens components are always interlocked to the correct vertical height.

## Profiling Information

| Max rising slope | $0.0^{\circ} \mathrm{C} / \mathrm{sec}$ to $3^{\circ} \mathrm{C} / \mathrm{sec}$ |
| :--- | :--- |
| Preheat time $150-200^{\circ} \mathrm{C}$, ts | $60-90 \mathrm{sec}$ |
| Time above Reflow $\left(\mathrm{T}_{\mathrm{L}}=220^{\circ} \mathrm{C}\right)$ | $50-100 \mathrm{sec}$ |
| Peak Temperature | $225-260^{\circ} \mathrm{C}$ |

## Soldering Profile

The recommended soldering profile is shown below.

Figure 3a. Recommended reflow profile

Figure 3b. Recommended Customer's PCB PADOUT and spacing

Figure 3c. Recommended Customer's PCB PADOUT and spacing

As ADBS-A350 is a QFN package, it is meant to be a contactdown package. The critical area for soldering ADBS-A350 is on the terminal undersides, while the terminal sides are deemed as non-critical area, and thus not intended to be wet-table. The non-wetting of the terminal sides is due to
exposed copper on the package side (which is expected and accepted), occurred after the singulation step, which is a standard process in QFN assembly. This is in line with the Industry Standard (for more information, please refer to IPC-A-610D: Acceptability of Electronics Assemblies).

Figure 3d. Bottom view of A350 (QFN package)

Cross sectional views of one terminal side
Figure 3e. Cross sectional views of A350
Critical and Non-critical areas of QFN soldering in Figure 3d and 3e

| Feature | Dimension | Class 1 | Class 2 | Class 3 |
| :--- | :--- | :--- | :--- | :--- |
| Maximum Side Overhang | A | $50 \%$ W, Note 1 | $25 \%$ W, Note 1 | 25\% W, Note 1 |
| Minimum End Joint Width | C | $50 \%$ W | $75 \%$ W | $75 \%$ W |
| Minimum Side Joint Length | D | Note 4 | Note 4 | Note 4 |
| Minimum Fillet Height | F | Notes 2, 5 | Notes 2, 5 | Notes 2, 5 |
| Solder Fillet Thickness | G | Note 3 | Note 3 | Note 3 |
| Termination Height | H | Note 5 | Note 5 | Note 5 |
| Land Width | P | Note 2 | Note 2 | Note 2 |
| Termination Width | W | Note 2 | Note 2 | Note 2 |

## Notes

1. Should not violate minimum electrical clearance.
2. Unspecified parameter. Variable in size as determined by design.
3. Good wetting is evident.
4. Is not a visual attribute for inspection.
5. Terminal sides are not required to be solderable. Toe fillets are not required.

1. Recommended Material: Panlite ${ }^{\oplus}$ L-1225R HF05084R Emerge-PC-4310-OPQ Makrolon 2405 Lexan 21051
2. Cosmetic requirements on all surface shal be SPI-D3 finish, unless otherwise noted.
3. Formula for dimension, $T=(0.9 / n)-0.07$ where $\mathrm{n}=$ Refractive Index
4. Mirror finish surface to be SPI-A2

Note: (Unless otherwise specified)

Figure 6a. Top cover drawing design

## Important notes for top cover designs:

1. The recommended transmissivity of top cover window is between $86 \%-92 \%$ from 800 nm to 940 nm with worst case minimum of $80 \%$ and maximum of $97 \%$ across this range of light spectrum.
2. The Assert/ Deassert thresholds must be recalculated and set in the sensor accordingly during initialization to address variation of surface reflection and transmissivity for custom cover designs. (See OFN firmware application note and OFN mechanical guide application note for further details).

[^0]

## Regulatory Requirements

- Passes FCC or CISPR 22 Class B emission limits when assembled following Avago Technologies recom-mendations.
- Passes IEC 61000-4-3 and IEC61000-4-6 Class A Immunity limits when assembled following Avago Technologies recommendation.

## Absolute Maximum Ratings

| Parameter | Symbol | Minimum | Maximum | Units | Notes |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Storage Temperature | $\mathrm{TS}_{S}$ | -40 | 85 | ${ }^{\circ} \mathrm{C}$ |  |
| Lead Solder Temp |  |  | 260 | ${ }^{\circ} \mathrm{C}$ | For 1.4 seconds |
| Moisture Sensitivity Level | MSL |  | 1 |  | Referring to JEDEC-J-STD-020 |
| Analog and Digital Supply Voltage | VDD | -0.5 | 2.1 | V |  |
| I/O Supply Voltage | V $_{\text {DDIO }}$ | -0.5 | 3.7 | V |  |
| LED Supply Voltage | VLED + | -0.5 | 2.1 | V |  |
| ESD (sensor only) |  |  | 2 | kV | All pins, human body model <br>  <br> Input Voltage |
| Latchup Current | VIN | -0.5 | $\mathrm{~V}_{\text {DDIO }+0.5}$ | V |  |

Note: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are the stress ratings only and functional operation of the device at these or any other condition beyond those indicated may affect device reliability.

## Recommended Operating Conditions

| Parameter | Symbol | Minimum | Typical | Maximum | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Operating Temperature | $\mathrm{T}_{\text {A }}$ | -20 |  | 70 | ${ }^{\circ} \mathrm{C}$ |  |
| Analog and Digital Supply Voltage ${ }^{[1]}$ | VDD | 1.7 | 1.8 | 2.1 | Volts | Including $\mathrm{V}_{\text {NA }}$ noise. |
| I/O Supply Voltage [2] | $\mathrm{V}_{\text {DDIO }}$ | 1.65 | 1.8 or 2.8 | 3.6 | Volts | Including $\mathrm{V}_{\text {NA }}$ noise. Sets I/O voltages. See fig 7. |
| LED Supply Voltage | VLED+ | 1.7 | 1.8 | 2 | Volts | Including $\mathrm{V}_{\text {NA }}$ noise. |
| Power Supply Rise Time | tVRT | 0.001 |  | 10 | ms | 0 to VDD. At minimum rise time, s/' |
| Power Supply Off Time for Valid POR (Power on Reset) | toff | 10 |  |  | ms | Refer to section "POR During Power Cycling" |
| Power Off Voltage Level for Valid POR (Power on Reset) | V OFF | 0 |  | 300 | mV | Refer to section "POR During Power Cycling" |
| Supply Noise (Sinusoidal) | $\mathrm{V}_{\text {NA }}$ |  |  | 100 | mV p-p | $10 \mathrm{kHz}-50 \mathrm{MHz}$ |
| Speed | S |  |  | 20 | in/sec | Using prosthetic finger as surface |
| Transient Supply Current | $I_{\text {DDT }}$ |  |  | 80 | mA | Max supply current for $500 \mu \mathrm{sec}$ for each supply voltages ramp from 0 to 1.8 V |

## Notes:

1. For operating temperature of less than $-20^{\circ} \mathrm{C}$ down to $-30^{\circ} \mathrm{C}$, minimum $V_{D D}$ of 1.8 V must be met.
2. To ensure minimum leakage current, VDDIO should be greater than or equal to VDD.

## Timing Specifications

Electrical Characteristics at $25^{\circ} \mathrm{C}, \mathrm{VDD}=\mathrm{VDDIO}=1.8 \mathrm{~V}$.

| Parameter | Symbol | Minimum | Typical | Maximum | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Motion Delay After Reset | $\mathrm{t}_{\text {MOT-RST }}$ | 3.5 |  | 23 | ms | From Hard reset or SOFT_RESET register write to valid register write/ read and motion, assuming motion is present |
| Shutdown | $\mathrm{t}_{\text {SHTDWN }}$ |  |  | 50 | ms | From SHTDWN pin active to low current |
| Wake from Shutdown | twakeup | 100 |  |  | ms | From SHTDWN pin inactive to valid motion. Refer to section "Notes on Shutdown", also note $\mathrm{t}_{\text {MOT-RST }}$ |
| EVENT_INT Rise Time | $\mathrm{t}_{\text {r-EVENT_INT }}$ |  | 150 | 300 | ns | $C_{L}=100 \mathrm{pF}$ |
| EVENT_INT Fall Time | $\mathrm{t}_{\text {f-EVENT_INT }}$ |  | 150 | 300 | ns | $C_{L}=100 \mathrm{pF}$ |
| SHTDWN Pulse Width | tp-SHTDWN | 150 |  |  | ms |  |
| NRST Pulse Width | $\mathrm{t}_{\text {NRST }}$ | 20 |  |  | $\mu \mathrm{s}$ | From edge of valid NRST pulse |
| Reset Wait Time After Stable Supply Voltage | tVRT-NRST | 100 |  |  | ms |  |

## DC Electrical Specifications

Electrical Characteristics at $25^{\circ} \mathrm{C}, \mathrm{VDD}=\mathrm{VDDIO}=1.8 \mathrm{~V}$ at default LED setting 13 mA .

| Parameter |  | Typical | Max | Units | Notes |

## Notes on Power-up Sequence

Below is the power up sequence for ADBS-A350:

## For SPI:

1. Apply power. Refer timing diagram on power up sequence below.
2. Set IO_NCS_A1 pin high. Set SHTDWN pin low. Set IO_ SELECT pin high.
3. Perform reset by driving NRST low then high OR by writing $0 \times 5 \mathrm{~A}$ to address $0 \times 3 \mathrm{~A}$.
4. Read Product ID (PID) to ensure sensor is powered up and communicating properly with host.
5. Write 0xE4 to address 0x60
6. Write $0 x C 9$ to address $0 \times 61$

For TWI:

1. Apply power. Refer timing diagram on power up sequence below.
2. Set SHTDWN and IO_SELECT pin low.
3. Set A0 and A1 according to the desired TWI slave address (from TWI slave address table in datasheet).
4. Drive NRST pin low then high. TWI slave address will only be valid and according to the address set in step 3 after a NRST toggle is applied.
5. Read Product ID (PID) to ensure sensor is powered up and communicating properly with host.
6. Write $0 x E 4$ to address $0 \times 60$
7. Write 0xC9 to address 0x61

## Note on register settings

Please refer to the OFN A350 firmware design guide for tuning of Speed Switching, Assert/De-assert, Finger Presence Detect and XY Quantization register settings.

## Notes on Shutdown and Reset

The ADBS-A350 can be set in Shutdown mode by asserting or setting SHTDWN pin high. During the shutdown state, supply voltages VDD must be maintained above the minimum level. If these conditions are not met, then the sensor must be restarted by powering down then powering up again for proper operation. Any register settings must then be reloaded.

During the shutdown state, supply voltage VDD must be maintained above the minimum level. For proper operation, SHTDWN pulse width must be at least tpSHTDWN. Shorter pulse widths may cause the chip to enter an undefined state. In addition, the SPI or TWI port of the sensor should not be accessed when SHTDWN is asserted. Other devices on the same SPI bus can be accessed, as long as the sensor's NCS pin is not asserted. The table below shows the state of various pins during shutdown. After deasserting SHTDWN, wait twaKEUP before accessing
the SPI port. Reinitializing the sensor from shutdown state will retain all register data that were written to the sensor prior to shutdown.

The reset of the sensor via SOFT_RESET register or through the NRST pin would reset all registers to the default value. Any register settings must then be reloaded.

| Pin | SHTDWN active |
| :--- | :--- |
| IO_NCS_A1 | Functional |
| IO_MISO_SDA | Undefined |
| IO_CLK | Undefined |
| IO_MOSI_A0 | Undefined |
| XY_LED | Low current |
| EVENT_INT | Undefined |
| NRST | High |
| IO_Select | SPI: High,TWI: Low |
| GPIO | Undefined |

Note: There are long wakeup times from shutdown. These features should not be used for power management during normal sensor motion.

## Power on Reset (POR) During Power Cycling

$t_{\text {VRT }}$ is the power supply (VDD) rise time specification for a valid power on reset to happen when the sensor is powered up from OV to VDD. At condition whereby the VDD of the sensor is cycled from VDD to 0 V and then to VDD again, the two parameters that govern a valid power on reset are voff and toff. Refer to timing diagram below.

Figure 8. Power on Reset during power cycling

## Power management modes

The ADBS-A350 has three power-saving modes. Each mode has a different motion detection period, affecting response time to sensor motion (Response Time). The sensor automatically changes to the appropriate mode, depending on the time since the last reported motion (Downshift Time). The parameters of each mode are shown in the following table.

| Mode | Response Time <br> (nominal) | Downshift Time <br> (nominal) |
| :--- | :--- | :--- |
| Rest 1 | 19.5 ms | 250 ms |
| Rest 2 | 96 ms | 9.5 s |
| Rest 3 | 482 ms | 582 s |

## EVENT_INT Pin

The Event_Int pin is a level-sensitive interrupt output that is used to trigger the host micro-controller when one of these events occurs:

- FPD - A change in finger state (finger on to finger off and vice versa) is detected
- Soft Click - Soft Click is detected
- Button - Mechanical button is asserted or de-asserted
- Motion - Motion delta is present.

A read to event register is required to determine the specific event that toggles the interrupt for user to act upon.

The EVENT_INT will be reset after the user responds to it by reading the respective event status register:

- FPD - reading FPD_STATUS register (0x7a)
- Soft Click - reading SC_STATUS register (0x7f)
- Button - reading BUTTON_STATUS register (0x12)
- Motion - reading DELTA_X and DELTA_Y registers until motion are cleared.

## GPIO Pin

The GPIO pin is a level-sensitive input/ output that can be used as

- FPD output - to display FPD status
- Pulse Width Modulated (PWM) output - to control LED driver to enable illumination feature in a product eg mobile phone
- Dome/ Button click input - can be connected to a dome switch that provides an input to the sensor and when a click is detected, sensor can respond by triggering button interrupt and channel the interrupt status through EVENT pin.

Refer to A350 Firmware Design Guide for more details and settings of registers for these features.

## LED Mode

For power savings, the LED will not be continuously on. ADBS-A350 will flash the LED only when needed.

## I/O Pin Status Test

This feature allows the user to verify the connectivity and the state of the I/O pin.

To run the test for input pins such as GPIO, SHUTDOWN, NRST and IO_SELECT, first enable the PAD_Chk_On bit (or bit-1) of OFN_ENGINE2 (0x61) register. Then write any value to PAD_STATUS ( $0 \times 31$ ) register to start the test. Wait for approximately 12 us before reading the actual pin status and PAD_STATUS register. The test will be considered a PASS to indicate the sensor is responding accordingly if the actual pin status matches PAD_STATUS register content. Refer to the table below for I/O pin status definition.

For output pins (EVENT_INT, GPIO, MOSI and MISO) testing, first enable bit-4 of PAD_FUNCTION ( $0 \times 34$ ) register. Then program or set the output state via PAD_ TEST_OUT register ( $0 \times 33$ ) and do a READ on the actual pin status. Actual pin status results should match the output set in PAD_TEST_OUT. (Note: SPI/TWI communication will be disabled after this test is enabled. Once this test is completed, an external hardware reset on sensor is required)

| Bit(s) | Name | Reset | Description | Remarks |
| :---: | :---: | :---: | :---: | :---: |
| 7:6 | NRST_STATE | 0x0 | 0x0: unknown |  |
|  |  |  | 0x1: Low | Invalid as the chip will be in reset state. |
|  |  |  | 0x2: High |  |
|  |  |  | 0x3: Hi-Z | Indicate a floating high |
| 5:4 | SHUTDOWN_STATE | 0x0 | 0x0: unknown |  |
|  |  |  | 0x1: Low |  |
|  |  |  | 0x2: High | Invalid as the chip will be in shutdown state. |
|  |  |  | 0x3: Hi-Z | Indicate a floating low |
| 3:2 | GPIO_STATE | 0x0 | 0x0: unknown |  |
|  |  |  | 0x1: Low |  |
|  |  |  | 0x2: High |  |
|  |  |  | 0x3: Hi-Z |  |
| 1:0 | IO_SELECT_STATE | 0x0 | 0x0: unknown |  |
|  |  |  | 0x1: Low |  |

## Fast Video Dump

ADBS-A350 comes with a unique feature that enables user to capture the image the optical sensor is seeing on the tracking surface. This is achieved through storing the pixel data, transferring or dumping the pixels data out to the host for processing and rebuilding the video dump image. The rebuilding of video dump image is mainly converting each 8-bit pixel data to form a grayscale digital image.

Some useful applications for this feature are sensor contamination inspection at manufacturing lines, image recognition, motion sensing applications and etc.

## Fast Video Dump Setups and Commands

Fast Video Dump (FVD) in the sensor requires three main signal lines for communications with host MCU as shown below.

| Pin | Status | Description |
| :--- | :--- | :--- |
| GPIO | Input | 24 MHz clock signal |
| MISO_SDA | Output | Pixel data bits 7 to 4 |
| EVENT_INT | Output | Pixel data bits 3 to 0 |

Connect an external clock signal of up to 24 MHz to GPIO pin. Execute the FVD commands below and capture the 64burst cycles of data clocked out on the two output pins (MISO_SDA and EVENT_INT).

## FVD Commands

1. Power up sensor
2. Read register $0 x 00$, to get returned value of $0 \times 88$ for correct product ID (ensure communication with sensor is established)
3. Write register $0 \times 3$ a with $0 \times 5 a$
4. Write register $0 \times 11$ with $0 \times 53$
5. Write register $0 \times 30$ with $0 \times 13$
6. Write register $0 \times 2 \mathrm{~b}$ with $0 \times 30$
7. Write register $0 \times 2 \mathrm{c}$ with $0 \times 13$
8. Write register $0 \times 28$ with $0 \times 01$ to initiate video dump.
9. Sensor will start to video dump for about 500 ms (see timing diagram on signals decoding versus actual signal captured).
10. Once video dump is completed, write register $0 \times 3$ a with 0x5a to soft reset sensor back to normal operation.
(Note: During FVD, the sensor is in 3-wire SPI communication with host MCU by design. Therefore a soft reset is necessary to reset back to 4-wire SPI communication for normal operation or to perform another FVD)
11. To capture another 64 burst cycles, repeat Step 2-Step10.

## Video Dump Signals Capturing and Decoding

64 burst cycles of FVD will be present on the MISO_SDA and EVENT_INT pins after executing the fast video dump commands.

Zooming into each burst cycle, 3 frames in each burst cycle will be observed.

As shown in Figure 9 above, frame start of video dump is denoted by MISO_SDA pin and EVENT_INT pin clocking high for 4 clock cycles or $4 \times$ b'11 (binary 11). Then after 4 clock cycles, MISO_SDA pin will go low and EVENT_INT pin remains high. This indicates pixel begin state.

The pixel read data will start to clock thereafter. Subsequent 4 bits are D7-D4 (on MISO_SDA) and D3-D0 (on EVENT_INT) followed by b'10 for pixel end (b'1 in MISO_ SDA, b'0 in EVENT_INT). This completes the first pixel data (address 0 ). The next pixel data (address 1 ) will begin with pixel begin state (b'01-0 in MISO_SDA, 1 in EVENT_INT) header followed by the 4 clock cycles of data followed by a pixel end state in the same manner. This will continue until all the 361 pixels ( $19 \times 19$ pixel array) data is read. Once done, the pixel end of the pixel data (address 360) will be followed by frame end state (b'00-0 in MISO_SDA, 0 in EVENT_INT). Refer to Figure 10.

Figure 9. Signals for frame start

Below is the pixel array address map. The figure shows the view of the chip from the top of the OFN aperture. Rows are read from top to bottom and columns from left to right. Pin 1

Pin 18

The signal to indicate the end of the video dump frame is shown in Figure 10 below where pix end state is followed by a low in both MISO_SDA and EVENT_INT. This will inform the Host of the pixel end and frame end state.

Figure 10. Frame End
Note: It is advisable to have a counter at the Host to keep count of the number of pixel addresses and data byte. If the number of pixel data byte does not correspond to the sensor number of pixel then this video dump data is invalid. In this case the sensor must be reset and a new video dump must be initiated.

## Fast Video Dump Image

These are some examples of grayscale images captured using fast video dump on an object' $\mathrm{A}^{\prime}$ (size of 1 mmx 1 mm ) at the surface of the sensor that is converted from the fast video dump data.

## 4-wire Serial Peripheral Interface (SPI)

## SPI Specifications

Electrical Characteristics over recommended operating conditions. Typical values at $25^{\circ} \mathrm{C}$, VDD $=1.8 \mathrm{~V}$.

| Parameter | Symbol | Minimum | Typical | Maximum | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Serial Port Clock Frequency | $\mathrm{f}_{\text {sclk }}$ |  |  | 1 | MHz | Active drive, 50\% duty cycle |
| MISO rise time | $\mathrm{t}_{\text {r-MISO }}$ |  | 150 | 300 | ns | $C_{L}=100 \mathrm{pF}$ |
| MISO fall time | $\mathrm{t}_{\mathrm{f} \text {-MISO }}$ |  | 150 | 300 | ns | $\mathrm{C}_{\mathrm{L}}=100 \mathrm{pF}$ |
| MISO delay after SCLK | tDLY_MISO |  |  | 120 | ns | From SCLK falling edge to MISO data valid, no load conditions |
| MISO hold time | thold_MISO | 0.5 |  | 1/fscLK | $\mu \mathrm{s}$ | Data held until next falling SCLK edge |
| MOSI hold time | thold_MOSI | 200 |  |  | ns | Amount of time data is valid after SCLK rising edge |
| MOSI setup time | $\mathrm{t}_{\text {setup_MOSI }}$ | 120 |  |  | ns | From data valid to SCLK rising edge |
| SPI time between write commands | tsww | 30 |  |  | $\mu \mathrm{s}$ | From rising SCLK for last bit of the first data byte, to rising SCLK for last bit of the second data byte. |
| SPI time between write and read commands | tswr | 20 |  |  | $\mu s$ | From rising SCLK for last bit of the first data byte, to rising SCLK for last bit of the second address byte. |
| SPI time between read and subsequent commands | tsRW tsRR | 500 |  |  | ns | From rising SCLK for last bit of the first data byte, to falling SCLK for the first bit of the address byte of the next command. |
| SPI read address-data delay | $\mathrm{t}_{\text {SRAD }}$ | 4 |  |  | $\mu \mathrm{s}$ | From rising SCLK for last bit of the address byte, to falling SCLK for first bit of data being read. |
| NCS inactive after motion burst | $\mathrm{t}_{\text {BEXIT }}$ | 500 |  |  | ns | Minimum NCS inactive time after motion burst before next SPI usage |
| NCS to SCLK active | $\mathrm{t}_{\text {NCs-SCLK }}$ | 120 |  |  | ns | From NCS falling edge to first SCLK falling edge |
| SCLK to NCS inactive (for read operation) | tsCLK-NCS | 120 |  |  | ns | From last SCLK rising edge to NCS rising edge, for valid MISO data transfer |
| SCLK to NCS inactive (for write operation) | tsCLK-NCS | 20 |  |  | us | From last SCLK rising edge to NCS rising edge, for valid MOSI data transfer |
| NCS to MISO high-Z | $\mathrm{t}_{\text {NCS-MISO }}$ |  |  | 500 | ns | From NCS rising edge to MISO high-Z state |

The synchronous serial port is used to set and read parameters in the ADBS-A350, and to read out the motion information.

The port is a four wire serial port. The host micro-controller always initiates communication; the ADBS-A350 never initiates data transfers. SCLK, MOSI, and NCS may be driven directly by a micro-controller. The port pins may be shared with other SPI slave devices. When the NCS pin is high, the inputs are ignored and the output is tri-stated.
The lines that comprise the 4-wire SPI port:
SCLK: Clock input. It is always generated by the master (the micro-controller).

MOSI: Input data. (Master Out/Slave In)
MISO: Output data. (Master In/Slave Out)
NCS: Chip select input (active low). NCS needs to be low to activate the serial port; otherwise, MISO will be high Z, and MOSI \& SCLK will be ignored. NCS can also be used to reset the serial port in case of an error.

## Chip Select Operation

The serial port is activated after NCS goes low. If NCS is raised during a transaction, the entire transaction is aborted and the serial port will be reset. This is true for all transactions. After a transaction is aborted, the normal address-to-data or transaction-to-transaction delay is still required before beginning the next transaction. To improve communication reliability, all serial transactions should be framed by NCS. In other words, the port should not remain enabled during periods of non-use because ESD events could be interpreted as serial communication and put the chip into an unknown state. In addition, NCS must be raised after each burst-mode transaction is complete to terminate burst-mode. The port is not available for further use until burst-mode is terminated.

## Write Operation

Write operation, defined as data going from the microcontroller to the ADBS-A350, is always initiated by the micro-controller and consists of two bytes. The first byte contains the address (seven bits) and has a " 1 " as its MSB to indicate data direction. The second byte contains the data. The ADBS-A350 reads MOSI on rising edges of SCLK.

Figure 11. Write Operation

Figure 12. MOSI Setup and Hold Time

## Read Operation

A read operation, defined as data going from the ADBS-A350 to the micro-controller, is always initiated by the microcontroller and consists of two bytes. The first byte contains the address, is sent by the micro-controller over MOSI, and has a " 0 " as its MSB to indicate data direction. The second byte contains the data and is driven by the ADBS-A350 over MISO. The sensor outputs MISO bits on falling edges of SCLK and samples MOSI bits on every rising edge of SCLK.

Figure 13. Read Operation

NOTE:The $0.5 / \mathrm{f}_{\text {SCLK }}$ minimum high state of SCLK is also the minimum MISO data hold time of the ADBS-A350. Since the falling edge of SCLK is actually the start of the next read or write command, the ADBS-A350 will hold the state of data on MISO until the falling edge of SCLK.

Figure 14. MISO Delay and Hold Time

## Required timing between Read and Write Commands

There are minimum timing requirements between read and write commands on the serial port.

Figure 15. Timing between two write commands

If the rising edge of the SCLK for the last data bit of the second write command occurs before the required delay ( $\mathrm{t}_{\mathrm{s} w w}$ ), then the first write command may not complete correctly.

Figure 16. Timing between write and read commands

If the rising edge of SCLK for the last address bit of the read command occurs before the required delay ( t sWR), the write command may not complete correctly.

Figure 17. Timing between read and either write or subsequent read commands

During a read operation SCLK should be delayed at least tsRAD after the last address data bit to ensure that the ADBS-A350 has time to prepare the requested data. The falling edge of SCLK for the first address bit of either the read or write command must be at least tSRR or tSRW after the last SCLK rising edge of the last data bit of the previous read operation.

## Burst Mode Operation

Burst mode is a special serial port operation mode that may be used to reduce the serial transaction time for a motion read. The speed improvement is achieved by continuous data clocking from multiple registers without the need to specify the register address, and by not requiring the normal delay period between data bytes.

Burst mode is activated by writing $0 \times 10$ to register 0x1c IO_MODE. Then the burst mode data can be read by reading the Motion register 0x02. The ADBS-A350 will respond with the contents of the Motion, Delta_Y, Delta_X, SQUAL, Shutter_Upper, Shutter_Lower and Maximum_ Pixel registers in that order. The burst transaction can be terminated after the first 3 bytes of the sequence are read by bringing the NCS pin high. After sending the register address, the micro-controller must wait $\mathrm{t}_{\text {SRAD }}$ and then begin reading data. All data bits can be read with no delay between bytes by driving SCLK at the normal rate. The data is latched into the output buffer after the last address bit is received. After the burst transmission is complete, the micro-controller must raise the NCS line for at least tBEXIT to terminate burst mode. The serial port is not available for use until it is reset with NCS, even for a second burst transmission.

Figure 18. Motion Burst Timing

## Two - Wire Interface (TWI)

ADBS-A350 uses a two-wire serial control interface compatible with I2C. The parameters are listed below.

## TWI Specifications

Electrical Characteristics over recommended operating conditions. Typical values at $25^{\circ} \mathrm{C}, \mathrm{VDD}=1.8 \mathrm{~V}$.

| Parameter | Symbol | Minimum | Maximum | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SCL clock frequency | fscl |  | 400 | kHz |  |
| Hold time (repeated) START condition. After this period, the first clock pulse is generated | thD_STA | 0.6 | - | $\mu \mathrm{s}$ |  |
| LOW period of the SCL clock | tow | 1.0 | - | $\mu \mathrm{s}$ |  |
| HIGH period of the SCL clock | $\mathrm{t}_{\text {HIGH }}$ | 0.6 | - | $\mu \mathrm{s}$ |  |
| Set up time for a repeated START condition | tsu_STA | 0.6 | - | $\mu \mathrm{s}$ |  |
| Data hold time | thD_DAT | $0^{(2)}$ | $0.9{ }^{(3)}$ | $\mu \mathrm{s}$ |  |
| Data set-up time | tsu_DAT | 100 | - | ns |  |
| Rise time of both SDA and SCL signals | $t_{r}$ | $20+0.1 C_{b}{ }^{(4)}$ | 300 | ns |  |
| Fall time of both SDA and SCL signals | $\mathrm{tf}_{f}$ | $20+0.1 C_{b}{ }^{(4)}$ | 300 | ns |  |
| Set up time for STOP condition | tsu_STo | 0.6 | - | $\mu \mathrm{s}$ |  |
| Bus free time between a STOP and START condition | $\mathrm{t}_{\text {BUF }}$ | 1.3 | - | $\mu \mathrm{s}$ |  |
| Capacitive load for each bus line | $C_{b}$ | - | 400 | pF |  |
| Noise margin at the LOW level for each connected device (including hysteresis) | $\mathrm{V}_{\mathrm{NL}}$ | 0.1 VDD | - | V |  |
| Noise margin at the HIGH level for each connected device (including hysteresis) | $\mathrm{V}_{\mathrm{NH}}$ | 0.2 VDD |  | V |  |

Notes:

1. All values referred to $\mathrm{V}_{\text {IHMIN }}$ and $\mathrm{V}_{\text {ILMAX }}$ levels.
2. A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the $\mathrm{V}_{\text {IHMIN }}$ of the SCL signal) to bridge the undefined region of the falling edge of SCL.
3. The maximum has $\mathrm{t}_{\text {HD_DAT }}$ only to be met if the device does not stretch the LOW period ( $\mathrm{t}_{\text {LOw }}$ ) of the SCL signal.
4. $C_{B}=$ total capacitance of one bus line in pF .

The ADBS-A350 responds to one of the following selectable slave device addresses depending on the IO_MOSI_ A0 and IO_NCS_A1 input pin state. These pins should be set to avoid conflict with any other devices that might be sharing the bus.
Table 1. TWI slave address

| A0 | A1 | Slave Address (Hex) |
| :--- | :--- | :--- |
| 0 | 0 | 33 |
| 0 | 1 | $3 b$ |
| 1 | 0 | 53 |
| 1 | 1 | 57 |

## Serial Transfer Clock and Serial Data signals

The serial control interface uses two signals: a serial transfer clock (SCL) signal and a serial data (SDA) signal. Always driven by the master, SCL synchronizes the serial transmission of data bits on SDA. The frequency of SCL may vary throughout a transfer, as long as the timing is greater than the minimum timing.
SDA is bi-directional. The host (master) can read from or write to the ADBS-A350. The host (typically a microcontroller) drives SCL and SDA in a write operation or requesting information from the ADBS-A350. The ADBS-A350 drives the SDA only under two conditions. First, when responding with an acknowledge (ACK) bit after receiving data from the host, or second, when sending data to the host at the host's request. Data is sent in Eight-bit packets.

## Start and Stop of Synchronous Operation

The host initiates and terminates all data transfers. Data transfers are initiated by driving SDA from high to low while holding SCL high. Data transfers are terminated by driving SDA from low to high while SCL is held high.

Figure 19. TWI Start and Stop operation

## Acknowledge/Not Acknowledge Bit

After a start condition, a single acknowledge/not acknowledge bit follows each Eight-bit data packet. The device receiving the data drives the acknowledge/not acknowledge signal on SDA. Acknowledge (ACK) is defined as 0 and not acknowledge (NAK) is defined as 1 .

## Packet Formats

Read and write operations between the host and the ADBS-A350 use three types of host driven packets and one type of ADBS-A350 driven packet. All packets are eight bits long with the most significant bit first, followed by an acknowledge bit.

Slave Device Address (DA)
Command packets contain a 7-bit ADBS-A350 device address and an active low read/write bit (R/W).

| First bit of |
| :--- |
| packet |

|  | Last bit of <br> packet |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Device Address |  |  |  |  |  | R/W |  |
| DA[6] | DA[5] | DA[4] | DA[3] | DA[2] | DA[1] | DA[0] | Write $=0$ <br> Read $=1$ |

## Register Address Packets (RA)

The address packets contain an auto-increment (ai) bit and a 7-bit address. If the'ai' bit is set, the slave will process data from successive addresses in successive bytes. For example, registers $0 \times 01,0 \times 02$, and $0 \times 03$ can be written by setting the 'ai' bit to one with address $0 \times 01$. The host would send three bytes of data, and the host would terminate with a $P$ condition.

| First bit of |
| :---: |
| packet |

| Auto <br> increment | Last bit of <br> packet |
| :---: | :--- | :--- |

| Auto <br> increment=1, <br> No <br> increment $=0$ | RA[6] | RA[5] | RA[4] | RA[3] | RA[2] | RA[1] | RA[0] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Data Packet (DP)

Contains 8 data bits and may be sent by the host or the ADBS-A350.

| First bit of |
| :--- |
| packet |

| Last bit of <br> packet |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $D P[7]$ | $D P[6]$ | $D P[5]$ | $D P[4]$ | $D P[3]$ | $D P[2]$ | $D P[1]$ | $D P[0]$ |

## Host Driven Packets

The host initiates all data transmission with a START condition. Next, slave address and register address packets are sent. If there is a device address match, the ADBS-A350 then responds to each Eight-bit data transmission with an acknowledge signal ( $\mathrm{SDA}=0$ ). Data is transmitted with the most significant bit first.

To terminate the transfer of host driven packets, the host follows the ADBS-A350's ACK with a STOP condition. The host can also issue a START condition after the ADBSA350's ACK if it wants to start a new data transfer.

Figure 20. Host packets

## ADBS-A350 Driven Packets

By request of the host, the ADBS-A350 acknowledges a read request and then outputs a data byte transmitting the most significant bit (7) first. If the host intends to continue the data transfer, the host acknowledges the ADBS-A350. If the host intends to terminate the transfer, it responds with not acknowledge (SDA = 1), and then drives SDA to generate a STOP condition. The host can also drive a START condition if it wants to begin a new data transfer with the same ADBS-A350.

Figure 21. Sensor packets

## Example: Writing Data to Sensor Registers

The host writes a value of $0 \times 02$ to address $0 \times 07$ in the following illustration.
The example ADBS-A350 address is $0 \times 57$.

Figure 22. TWI write

## Example: Single Byte Read from Sensor Register

The sensor reads a value $0 \times 01$ from the register address $0 \times 02$ in the following illustration. Again, the example ADBS-A350 address is $0 \times 57$.

Figure 23. TWI single byte read

## Example: Polling of Status register (X-Y Motion Bit and Button bits)

To poll the STATUS register, the following structure can be used:

Figure 24. TWI polling

In this case, the host read ADBS-A350 data packets until the update bit (bit 4). Then the host could read successive registers using the ai bit example below.
Note: polling the Status register rather than using the DATA_RDY pin increases power consumption

## Example: Multiple-Byte Read from Sensor Register using'ai' bit

The ai is a useful feature, especially in the case of reading Delta_X, Delta_Y, and Delta_HI in succession once either the DATA_RDY interrupt pin and/or update bit in the STATUS register bit are set.

Once the ai bit is set, the slave will deliver data packets from successive addresses until the 'STOP' condition from the host.

In the example below, 3 bytes are read successively from registers $0 \times 03,0 \times 04$, and $0 \times 05$.

Figure 25. TWI ai bit

## SCL and SDA Timing

Figure 26. TWI SCL and SDA Timing

## ADBS-A350 driven SDA

Figure 27. Sensor driven SDA

## Registers

The ADBS-A350 registers are accessible via the serial port. The registers are used to read motion data and status as well as to set the device configuration.

| Address | Register | Read/ <br> Write | Default Value | Address | Register | Read/ <br> Write | Default Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Data Type: 8-Bit unsigned integer.
USAGE: This register contains a unique identification assigned to the ADBS-A350. The value in this register does not change; it can be used to verify that the serial communications link is functional.

| Revision_ID <br> Access: Read |  |  | Address: $0 \times 01$ <br> Reset Value: $0 \times 00$ |  |  |  |  |  |  |

Data Type: 8-Bit unsigned integer.
USAGE: This register contains the IC revision. It is subject to change when new IC versions are released.

## Event

Access: Read/Write

Address: 0x02
Reset Value: Any

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | MOT | PIXRDY | PIXFIRST | OVFL | RESET_ST | BUT_CLICK | SOFT_CLICK | FPD |

Data Type: Bit field.
USAGE: Event detect register ( $0 \times 02$ ) allows user to determine if any event interrupts (FPD, Motion, Soft click or Button click) has occurred since the last time it was read. If the MOT bit is set, then the user should read registers $0 \times 03$ and $0 \times 04$ to get the accumulated motion. Read this register before reading the Delta_ Y and Delta_X registers. Writing anything to this register clears the MOT and OVFL bits, Delta_Y and Delta_X registers. The written data byte is not saved.
Internal buffers can accumulate more than eight bits of motion for X or Y . If any of the internal buffers overflow, then absolute path data is lost and the OVFL bit is set. This bit is cleared once some motion has been read from the Delta_X and Delta_Y registers, and if the buffers are not at full scale. Since more data is present in the buffers, the cycle of reading the Event, Delta_X and Delta_Y registers should be repeated until the motion bit (MOT) is cleared. If the Event register has not been read for long time, at 500 cpi it may take up to 16 read cycles to clear the buffers, at 1000 cpi , up to 32 cycles. To clear an overflow, write anything to this register.

The PIXRDY bit will be set whenever a valid pixel data byte is ready and available in the Pixel_Dump register. Check that this bit is set before reading from Pixel_Dump. To ensure that the Pixel_Grab pointer has been reset to pixel 0,0 on the initial write to Pixel_Grab, check to see if PIXFIRST is set to high.

| Field Name | Description |
| :---: | :---: |
| MOT | Motion since last report <br> $0=$ No motion <br> 1 = Motion occurred, data ready for reading in Delta_X and Delta_Y registers <br> Bit reset when motion data in Delta_X and Delta_Y registers are cleared |
| PIXRDY | Pixel Dump data byte is available in Pixel_Dump register $\mathbf{0}=$ data not available <br> 1 = data available |
| PIXFIRST | This bit is set when the Pixel_Grab register is written to or when the complete pixel array has been read, initiating an increment to pixel 0,0. <br> $0=$ Pixel_Grab data not from pixel 0,0 <br> 1 = Pixel_Grab data is from pixel 0,0 |
| OVF | Motion overflow, $\Delta \mathrm{Y}$ and/or $\Delta \mathrm{X}$ buffer has overflowed since last report 0 = no overflow <br> 1 = Overflow has occurred |
| RESET_ST | Reset status bit. Any internal or external reset will set this bit. Write anything to this register to clear it. $\begin{aligned} & 0=\text { No reset } \\ & 1=\text { Reset occurred } \end{aligned}$ |
| BUT_CLICK | Button click report <br> 0 = No Button click <br> 1 = Button click occurred <br> Bit clear or reset by reading BUTTON_STATUS (0x12) register |
| SOFT_CLICK | Soft click report <br> $\mathbf{0}=$ No Soft click <br> 1 = Soft click occurred <br> Bit clear or reset by reading SC_STATUS (0x7F) register |
| FPD | Finger presence detect bit reports a change in finger state (finger on to finger off and vice versa) <br> $0=$ No finger state change detected <br> 1 = Finger state change detected <br> Bit clear or reset by reading FPD_STATUS (0x7A) register |

Delta_X
Access: Read

Address: 0x03
Reset Value: Any

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $Y_{7}$ | $Y_{6}$ | $Y_{5}$ | $Y_{4}$ | $Y_{3}$ | $Y_{2}$ | $Y_{1}$ | $Y_{0}$ |

Data Type: Eight bit 2's complement number.
USAGE: X movement is counts since last report. Absolute value is determined by resolution. Reading clears the register.

NOTES: Avago RECOMMENDS that registers $0 \times 03$ and $0 \times 04$ be read sequentially.

Delta_Y
Access: Read

Address: 0x04
Reset Value: Any

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $X_{7}$ | $X_{6}$ | $X_{5}$ | $X_{4}$ | $X_{3}$ | $X_{2}$ | $x_{1}$ | $X_{0}$ |

Data Type: Eight bit 2's complement number.
USAGE: Y movement is counts since last report. Absolute value is determined by resolution. Reading clears the register.

NOTES: Avago RECOMMENDS that registers $0 \times 03$ and $0 \times 04$ be read sequentially.

| SQUAL <br> Access: Read |  |  | Address: 0x05 <br> Reset Value: Any |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Field | $\mathrm{SQ}_{7}$ | $\mathrm{SQ}_{6}$ | $\mathrm{SQ}_{5}$ | $\mathrm{SQ}_{4}$ | $\mathrm{SQ}_{3}$ | $\mathrm{SQ}_{2}$ | $\mathrm{SQ}_{1}$ | $\mathrm{SQ}_{0}$ |

Data Type: Upper 8 bits of a 9-bit unsigned integer.
USAGE: SQUAL (Surface Quality) is a measure of the number of valid features visible by the sensor in the current frame. The maximum SQUAL register value is 167 . Since small changes in the current frame can result in changes in SQUAL, variations in SQUAL when looking at a surface are expected.

| Shutter_Upper <br> Access: Read |  | Address: 0x06 <br> Reset Value: Any |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| Field | $\mathrm{S}_{15}$ | $\mathrm{~S}_{14}$ | $\mathrm{~S}_{13}$ | $\mathrm{~S}_{12}$ | $\mathrm{~S}_{11}$ | $\mathrm{~S}_{10}$ | $\mathrm{~S}_{9}$ | $\mathrm{~S}_{8}$ |  |

Shutter_Lower Address: 0x07
Access: Read Reset Value: Undefined

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $\mathrm{S}_{7}$ | $\mathrm{~S}_{6}$ | $\mathrm{~S}_{5}$ | $\mathrm{~S}_{4}$ | $\mathrm{~S}_{3}$ | $\mathrm{~S}_{2}$ | $\mathrm{~S}_{1}$ | $\mathrm{~S}_{0}$ |

Data Type: Sixteen bit unsigned integer.
USAGE: Units are clock cycles. Read Shutter_Upper first, then Shutter_Lower. They should be read consecutively. The shutter is adjusted to keep the average and maximum pixel values within normal operating ranges. The shutter value is automatically adjusted.

## Maximum_Pixel

Access: Read

Address: 0x08
Reset Value: Any

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $\mathrm{MP}_{7}$ | $\mathrm{MP}_{6}$ | $\mathrm{MP}_{5}$ | $\mathrm{MP}_{4}$ | $M P_{3}$ | $\mathrm{MP}_{2}$ | $\mathrm{MP}_{1}$ | $\mathrm{MP}_{0}$ |

Data Type: Eight-bit number.
USAGE: Maximum Pixel value in current frame. Minimum value $=0$, maximum value $=254$. The maximum pixel value can vary with every frame.

| Pixel_Sum <br> Access: Read |  | Address: 0x09 <br> Reset Value: Any |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| Field | $\mathrm{AP}_{7}$ | $\mathrm{AP}_{6}$ | $\mathrm{AP}_{5}$ | $A P_{4}$ | $A P_{3}$ | $A P_{2}$ | $A P_{1}$ | $A P_{0}$ |  |

Data Type: High 8 bits of an unsigned 17-bit integer.
USAGE: This register is used to find the average pixel value. It reports the seven bits of a 16-bit counter, which sums all pixels in the current frame. It may be described as the full sum divided by 512 . To find the average pixel value, use the following formula:

Average Pixel $=$ Register Value * 128/121 = Register Value * 1.06
The maximum register value is 240 . The minimum is 0 . The pixel sum value can change every frame.

| Minimum_Pixel <br> Access: Read |  | Address: 0x0a <br> Reset Value: Any |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| Field | $\mathrm{MP}_{7}$ | $\mathrm{MP}_{6}$ | $\mathrm{MP}_{5}$ | $\mathrm{MP}_{4}$ | $\mathrm{MP}_{3}$ | $\mathrm{MP}_{2}$ | $\mathrm{MP}_{1}$ | $\mathrm{MP}_{0}$ |  |

Data Type: Eight-bit number.
USAGE: Minimum Pixel value in current frame. Minimum value $=0$, maximum value $=254$. The minimum pixel value can vary with every frame.

Pixel_Grab
Access: Read/Write

Address: 0x0b
Reset Value: Any

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $\mathrm{PD}_{7}$ | $\mathrm{PD}_{6}$ | $\mathrm{PD}_{5}$ | $\mathrm{PD}_{4}$ | $\mathrm{PD}_{3}$ | $\mathrm{PD}_{2}$ | $\mathrm{PD}_{1}$ | $\mathrm{PD}_{0}$ |

Data Type: Eight-bit word.
USAGE: For test purposes, the sensor will read out the contents of the pixel array, one pixel per frame. To start a pixel grab, write anything to this register to reset the pointer to pixel 0,0 . Then read the PIXRDY bit in the Motion register. When the PIXRDY bit is set, there is valid data in this register to read out. After the data in this register is read, the pointer will automatically increment to the next pixel. Reading may continue indefinitely; once a complete frame's worth of pixels has been read, PIXFIRST will be set to high to indicate the start of the first pixel and the address pointer will start at the beginning location again. The pixel map address and corresponding sensor orientation is shown below.

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |

CRCO
Access: Read

Address: 0x0c
Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $\mathrm{CRCO}_{7}$ | $\mathrm{CRCO}_{6}$ | $\mathrm{CRCO}_{5}$ | $\mathrm{CRCO}_{4}$ | $\mathrm{CRCO}_{3}$ | $\mathrm{CRCO}_{2}$ | $\mathrm{CRCO}_{1}$ | $\mathrm{CRCO}_{0}$ |

Data Type: Eight-bit number
USAGE: Register 0x0c reports the first byte of the system self test results. See Self Test register 0x10.

## CRC1

Access: Read Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $\mathrm{CRC1}_{7}$ | $\mathrm{CRC1}_{6}$ | $\mathrm{CRC1}_{5}$ | $\mathrm{CRC1}_{4}$ | $\mathrm{CRC1}_{3}$ | $\mathrm{CRC1}_{2}$ | $\mathrm{CRC1}_{1}$ | $\mathrm{CRC1}_{0}$ |

Data Type: Eight-bit number
USAGE: Register 0x0d reports the second byte of the system self test results. See Self Test register 0x10.

Data Type: Eight-bit number
USAGE: Register 0x0e reports the third byte of the system self test results. See Self Test register 0x10.

Data Type: Eight-bit number
USAGE: Register 0x0f reports the fourth byte of the system self test results. See Self Test register 0x10.

| Self_Test | Address: $0 \times 10$ |
| :--- | :--- |
| Access: Write | Reset Value: $0 \times 00$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved | TESTEN |

Data Type: Bit field
USAGE: Set the TESTEN bit in register $0 \times 10$ to start the system self-test. The test takes 250 ms . During this time, do not write or read through the SPI and I2C ports. Results are available in the CRCO-3 registers.

| Field Name | Description |
| :--- | :--- |
| TESTEN | Enable System Self Test |
|  | $0=$ Disable |
|  | $1=$ Enable |

The procedure to start self test is as follows:-

1. Perform power up sequence (refer to page 11 of datasheet)
2. Write data $0 \times 5 \mathrm{~A}$ to register $0 \times 3 \mathrm{~A}$ to initiate soft reset.
3. Write data $0 \times C 1$ to register $0 \times 29$.
4. Write data $0 \times 59$ to register $0 \times 11$
5. Write data $0 \times F F$ to register $0 \times 60$.
6. Write data $0 \times 88$ to register $0 \times 61$.
7. Write data $0 x A A$ to register $0 \times 72$.
8. Write data $0 \times C 4$ to register $0 \times 63$
9. Write data $0 \times 20$ to register $0 \times 75$
10. Write data $0 \times 05$ to register $0 \times 76$
11. Write data $0 \times 04$ to register $0 \times 7 \mathrm{C}$
12. Write data $0 \times F F$ to register $0 \times 7 \mathrm{E}$
13. Write data $0 \times 01$ to register $0 \times 10$ to initiate self test.
14. Wait 250 ms .
15. Read CRC0 from address 0x0c, CRC1 from address 0x0d, CRC2 from address 0x0e, CRC3 from address 0x0f. 16. After self test, execute power up sequence again.

The results are as follows.

| CRC\# |  |
| :--- | :--- |
| CRC0 | $0 \times 3 E$ |
| CRC1 | $0 \times 5 \mathrm{C}$ |
| CRC2 | $0 \times A 4$ |
| CRC3 | $0 \times 24$ |

| BUTTON_STATUS | Address: $0 \times 12$ |
| :--- | :--- |
| Access: Read/Write | Reset Value: $0 \times 00$ |

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | Assert <br> count | Assert <br> count | Deassert <br> count | Deassert <br> count | Reserved | Reserved | Reserved | But_Status |

Data Type: Bit field
USAGE: Register $0 \times 12$ allows the user to read button status. Writing any value to this register will restart the counter.

| Field Name | Description |
| :--- | :--- |
| Assert count 7:6 | Counts for number of times the button state change from 0 to 1 |
| Deassert count 5:4 | Counts for number of times the button state change from 1 to 0 |
| But_Status | Button current status |

| Run_Downshift <br> Access: Read/Write |  | Address: 0x13 <br> Reset Value: $0 \times 04$ |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| Field | $\mathrm{RD}_{7}$ | $\mathrm{RD}_{6}$ | $\mathrm{RD}_{5}$ | $\mathrm{RD}_{4}$ | $\mathrm{RD}_{3}$ | $\mathrm{RD}_{2}$ | $\mathrm{RD}_{1}$ | $\mathrm{RD}_{0}$ |  |

This register set the Run to Rest 1 downshift time.
Run Downshift time $=$ RD[7:0] $\times 8 \times$ Run_rate.
Default value: $4 \times 8 \times 8 \mathrm{~ms}=256 \mathrm{~ms}$
$\begin{array}{ll}\text { Min: } & 2 \times 8 \times 8 \mathrm{~ms}=128 \mathrm{~ms} \\ \text { Max: } & 242 \times 8 \times 8 \mathrm{~ms}=15,488 \mathrm{~ms}=15.49 \mathrm{~s}\end{array}$
All the above values are calculated base on 25 MHz System clock.

This register set the Rest 1 frame rate.
Rest 1 frame rate $=(\operatorname{R1R}[7: 0]+1) \times 10 \mathrm{~ms}$.
Default value: $2 \times 10 \mathrm{~ms}=20 \mathrm{~ms}$
Min: $\quad 2 \times 10 \mathrm{~ms}=20 \mathrm{~ms}$
Max: $\quad 241 \times 10 \mathrm{~ms}=2,410 \mathrm{~ms}=2.41 \mathrm{~s}$
All the above values are calculated base on 100 Hz Hibernate clock.

Rest1_Downshift
Access: Read/Write

Address: 0x15
Reset Value: 0x1f

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Field | R1D ${ }_{7}$ | R1D ${ }_{6}$ | R1D ${ }_{5}$ | R1D ${ }_{4}$ | R1D ${ }_{3}$ | R1D 2 | R1D ${ }_{1}$ | R1 $\mathrm{D}_{0}$ |

This register set the Rest 1 to Rest 2 downshift time.
Rest1 Downshift time $=$ R1D[7:0] $\times 16 \times$ Rest1_Rate.
Default value: $31 \times 16 \times 20 \mathrm{~ms}$ (Rest1_Rate default) $=9,920 \mathrm{~ms}=9.92 \mathrm{~s}$
$\begin{array}{ll}\text { Min: } & 1 \times 16 \times 20 \mathrm{~ms}(\text { Rest1_Rate } \min )=320 \mathrm{~ms} \\ \text { Max: } & 242 \times 16 \times 2.56 \mathrm{~s}(\text { Rest1_Rate } \max )=9,912 \mathrm{~s}=165 \mathrm{~min}=2.75 \mathrm{hr}\end{array}$
All the above values are calculated base on 100 Hz Hibernate clock.

Rest2_Period
Access: Read/Write

Address: 0x16
Reset Value: 0x09

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $R_{2} R_{7}$ | $R_{2} R_{6}$ | $R_{2} R_{5}$ | $R_{2} R_{4}$ | $R_{2} R_{3}$ | $R_{2} R_{2}$ | $R_{2} R_{1}$ | $R_{2} R_{0}$ |

This register set the Rest 2 frame rate.
Rest2 frame rate $=(\operatorname{R2R}[7: 0]+1) \times 10 \mathrm{~ms}$.
Default value: $10 \times 10 \mathrm{~ms}=100 \mathrm{~ms}$
Min: $\quad 2 \times 10 \mathrm{~ms}=20 \mathrm{~ms}$
Max: $\quad 241 \times 10 \mathrm{~ms}=2,410 \mathrm{~ms}=2.41 \mathrm{~s}$
All the above values are calculated base on 100 Hz Hibernate clock.

| Rest2_Downshift <br> Access: Read/Write |  |  | Address: 0x17 <br> Reset Value: 0x2f |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Field | $\mathrm{R} 2 \mathrm{D}_{7}$ | R2D ${ }_{6}$ | R2D5 | R2D ${ }_{4}$ | R2D ${ }_{3}$ | R2D ${ }_{2}$ | R2D ${ }_{1}$ | R2D ${ }_{0}$ |

This register set the Rest 2 to Rest 3 downshift time.
Rest2 Downshift time $=$ R2D[7:0] $\times 128 \times$ Rest2_Rate.
Default value: $47 \times 128 \times 100 \mathrm{~ms}$ (Rest2_Rate default) $=601.6 \mathrm{~s}=10 \mathrm{~min}$
Min: $\quad 1 \times 128 \times 20 \mathrm{~ms}($ Rest2_Rate $\min )=2560 \mathrm{~ms}=2.56 \mathrm{~s}$
Max: $\quad 242 \times 128 \times 2.56 \mathrm{~s}($ Resr2_Rate $\max )=79,298 \mathrm{~s}=1,321 \mathrm{~min}=22 \mathrm{hrs}$
All the above values are calculated base on 100 Hz Hibernate clock.

Rest3_Period
Access: Read/Write

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | $R 3 R_{7}$ | $R 3 R_{6}$ | $R 3 R_{5}$ | $R 3 R_{4}$ | $R 3 R_{3}$ | $R 3 R_{2}$ | $R 3 R_{1}$ | $R_{3} R_{0}$ |

This register set the Rest 3 frame rate.
Rest3 frame rate $=(\operatorname{R3R}[7: 0]+1) \times 10 \mathrm{~ms}$.
Default value: $50 \times 10 \mathrm{~ms}=500 \mathrm{~ms}$
$\begin{array}{ll}\text { Min: } & 2 \times 10 \mathrm{~ms}=20 \mathrm{~ms} \\ \text { Max: } & 241 \times 10 \mathrm{~ms}=2,410 \mathrm{~ms}=2.41 \mathrm{~s}\end{array}$
All the above values are calculated base on 100 Hz Hibernate clock.

Data Type: Bit field
USAGE: This register is used to set time between first click and second click to trigger double click. Any second successive click within this time will be considered a double click.

| Field Name | Description |
| :--- | :--- |
| SC_Dou 7:0 | Sets waiting time after single click for double click to happen |

| SC_DELTA_THRESH <br> Access: |  | Address: 0x7e <br> Reset Value: $0 \times 19$ |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Field | SC_Delta | SC_Delta | SC_Delta | SC_Delta | SC_Delta | SC_Delta | SC_Delta | SC_Delta |

Data Type: Bit field
USAGE: This register is used to set sensor single click threshold.

| Field Name | Description |
| :--- | :--- |
| SC_Delta 7:0 | Threshold to validate single click. Single click is only valid if motion delta sum <br> (Delta_X + Delta_Y) is less than threshold. Units are in 500 cpi. |

## SC_STATUS Address: 0x7f <br> Access: Read/Write Reset Value: 0x00

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Field | Reserved | Reserved | Reserved | Reserved | Reserved | Tap+N_ <br> Hold | Double <br> Click | Single_ <br> Click |

Data Type: Bit field
USAGE: This register is used to confirm which soft click has been triggered when there is a soft click interrupt being triggered.
\(\left.\begin{array}{ll}\hline Field Name \& Description <br>
\hline Tap_N_Hold \& 0=Tap and Hold not detected <br>

\& 1=Tap and Hold detected\end{array}\right]\)| Double_Click | $=$ Double click not detected |
| :--- | :--- |
|  | $1=$ Double click detected |
