

AT-42000

Up to 6 GHz Medium Power Silicon Bipolar Transistor Chip

Data Sheet

Description

Avago's AT-42000 is a general purpose NPN bipolar transistor chip that offers excellent high frequency performance. The 4 micron emitter-to-emitter pitch enables this transistor to be used in many different functions. The 20 emitter finger interdigitated geometry yields a medium sized transistor with impedances that are easy to match for low noise and medium power applications.

This device is designed for use in low noise, wideband amplifier, mixer and oscillator applications in the VHF, UHF, and microwave frequencies. An optimum noise match near 50Ω up to 1 GHz, makes this device easy to use as a low noise amplifier.

The AT-42000 bipolar transistor is fabricated using Avago's 10 GHz ft Self-Aligned-Transistor (SAT) process. The die is nitride passivated for surface protection. Excellent device uniformity, performance and reliability are produced by the use of ionimplantation, self-alignment techniques, and gold metalization in the fabrication of this device.

The recommended assembly procedure is gold-eutectic die attach at 400°C and either wedge or ball bonding using 0.7 mil gold wire. See APPLICATIONS section, "Chip Use".

AT-42000 Absolute Maximum Ratings

Symbol	Parameter	Units	Absolute Maximum ^[1]
V _{EBO}	Emitter-Base Voltage	V	1.5
V _{CBO}	Collector-Base Voltage	V	20
V _{CEO}	Collector-Emitter Voltage	V	12
I _C	Collector Current	mA	80
P _T	Power Dissipation ^[2,3]	mW	600

T _{STG}	Storage Temperature	°C	-65 to 200

Thermal Resistance ^[2,4]:
 $\theta_{jc} = 70^{\circ}\text{C/W}$

Notes:

1. Permanent damage may occur if any of these limits are exceeded.
2. T_{Mounting Surface} = 25°C.
3. Derate at 14.3 mW/°C for T_{Mounting Surface} > 158°C.
4. The small spot size of this technique results in a higher, though more accurate determination of θ_{jc} than do alternate methods. See MEASUREMENTS section "Thermal Resistance" for more information.
