

Features

- Zero Input Output Propagation Delay, adjustable by Capacitive Load on FBK input
- Multiple configurations (see [Table 3](#) on page 4)
- Multiple Low-skew Outputs
 - 45 ps Typical Output-output skew (-1)
 - Two banks of four Outputs, three-stateable by two select Inputs
- 10 MHz to 140 MHz Operating Range
- 65 ps Typical Cycle-to-cycle Jitter (-1, -1H)
- Advanced 0.65 μm CMOS Technology
- Space saving 16-pin, SOIC and TSSOP Packages
- 3.3V Operation
- Spread Aware

Functional Description

The CY23S08 is a 3.3V zero delay buffer designed to distribute high speed clocks in PC, workstation, datacom, telecom, and other high performance applications.

The part has an on-chip PLL which locks to an input clock presented on the REF pin. The PLL feedback must be driven into the FBK pin, and obtained from one of the outputs. The input-to-output propagation delay is less than 350 ps, and output-to-output skew is less than 250 ps.

The CY23S08 has two banks of four outputs each, which can be controlled by the Select inputs as shown in [Table 2](#) on page 4. If all output clocks are not required, Bank B can be three-stated. The select inputs also enable the input clock to be directly applied to the output for chip and system testing purposes.

The CY23S08 PLL enters a power down state when there are no rising edges on the REF input. In this mode, all outputs are three-stated and the PLL is turned off, resulting in less than 50 μA of current draw. The PLL shuts down in two additional cases as shown in [Table 2](#) on page 4.

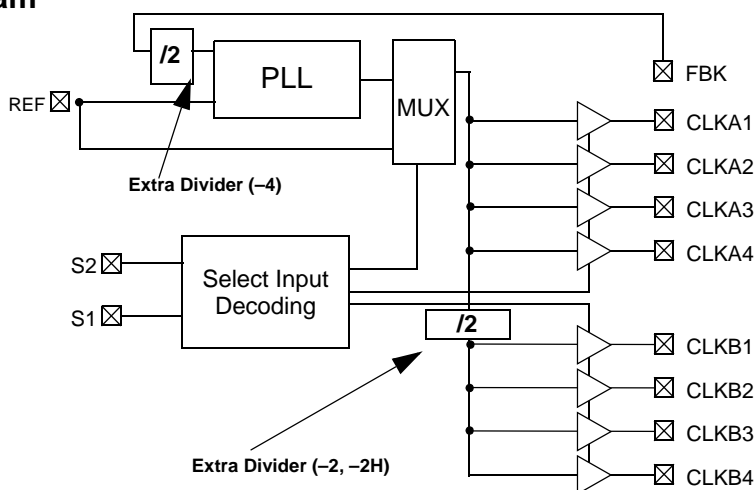

Multiple CY23S08 devices accept the same input clock and distribute it in a system. In this case, the skew between the outputs of two devices is less than 700 ps.

The CY23S08 is available in five different configurations, as shown in [Table 3](#) on page 4. The CY23S08-1 is the base part, where the output frequencies equal the reference if there is no counter in the feedback path. The CY23S08-1H is the high drive version of the -1, and rise and fall times on this device are much faster.

The CY23S08-2 enables you to obtain 2X and 1X frequencies on each output bank. The exact configuration and output frequencies depends on which output drives the feedback pin. The CY23S08-2H is the high drive version of the -2, and rise and fall times on this device are much faster.

The CY23S08-4 enables you to obtain 2X clocks on all outputs. Thus, the part is versatile, and can be used in a variety of applications.

Spread Aware

Many systems designed now use the Spread Spectrum Frequency Timing Generation (SSFTG) technology. Cypress is one of the pioneers of SSFTG development, and designed this product so as not to filter off the Spread Spectrum feature of the Reference input, assuming it exists. When a zero delay buffer does not pass through the SS feature, the result is a significant amount of tracking skew which may cause problems in systems requiring synchronization.

For more details on Spread Spectrum timing technology, please see Cypress's application note [EMI Suppression Techniques with Spread Spectrum Frequency Timing Generator \(SSFTG\) ICs](#).

Note

4. Output phase is indeterminant (0° or 180° from input clock). If phase integrity is required, use the CY23S08–2.

Notes

- Multiple Supplies: The voltage on any input or IO pin cannot exceed the power pin during power up. Power supply sequencing is NOT required.
- Applies to both Ref Clock and FBK.
- Parameter is guaranteed by design and characterization. Not 100% tested in production.
- All parameters are specified with loaded outputs.
