

## Features

- Output: 216 MHz Output Clock
- Input: External 27 MHz Crystal
- Differential LVDS Output with 2x Drive to Drive Two Loads
- VCXO gives 230 ppm Minimum Pull Range
- Low RMS Phase Jitter (12 kHz–20 MHz): 1.3 ps Typical
- Low Phase Noise
- Fully Integrated Low Noise Phase Locked Loop (PLL)
- Excellent Voltage-to-Frequency Linearity
- Supply Voltage: 3.3V
- Pb-free 16-Pin TSSOP Package

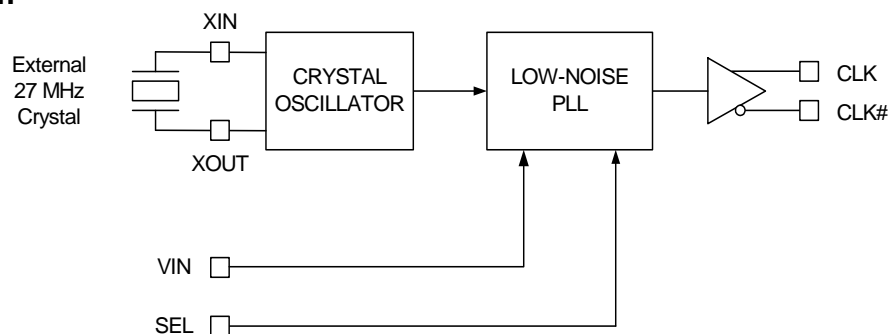

## Description

The CY2VC521-2 is a PLL-based clock generator with VCXO control and very low output jitter. When the user connects a fundamental mode 27 MHz crystal, this device generates a 216 MHz output clock. The CY2VC521-2 has one LVDS output pair tuned to drive two standard LVDS loads and operates from a single 3.3V power supply.

The VIN pin is an analog input that enables the user to pull the output frequency. The pullability range is at least 230 ppm ( $\pm 115$  ppm).

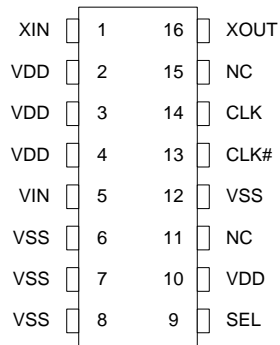

Unlike conventional VCXO designs, the output frequency adjustment is not achieved by adjusting capacitance at the pins of the crystal. Instead, a proprietary PLL design is used. This permits the use of a standard 27 MHz crystal. A special “pullable” crystal is neither required nor recommended.

## Logic Block Diagram

## Pinout

**Figure 1. Pin Diagram - 16-Pin TSSOP**

**Table 1. Pin Definitions - 16-Pin TSSOP**

Pin	Name	Type	Description
1	XIN	Crystal	Oscillator Input: Connect a 27 MHz crystal between XIN and XOUT
16	XOUT	Crystal	Oscillator Output: Connect a 27 MHz crystal between XIN and XOUT
5	VIN	Analog Input	VCXO Control Voltage: VIN has a positive control slope, meaning that increasing the voltage on VIN causes the output frequency to increase. The nominal output frequency is determined when VIN = 1.65V
13, 14	CLK#, CLK	LVDS Output	Differential output clock
9	SEL	CMOS Input	Select: Hold this pin LOW for normal operation
11, 15	NC	—	No Connect: NC pins are not connected to the die
2, 3, 4, 10	VDD	—	3.3V power supply
6, 7, 8, 12	VSS	—	Ground

## Frequency Table

Inputs		Output Frequency (MHz)
Xtal Frequency (MHz)	PLL Multiplier Value	
27	8	216

## VCXO and VIN

The output frequency of the device is adjusted over a limited range by use of the VCXO feature. This feature is typically used to phase and frequency lock to a separate reference clock. The frequency is controlled by the analog voltage on the VIN pin. The nominal output frequency is generated when  $V_{IN} = 1.65V$ . As the voltage on VIN is increased, the output frequency increases. The voltage range for VIN is from 0V ( $V_{SS}$ ) to  $V_{DD}$ .

## Application Information

### Power Supply Filtering Techniques

As in any high speed analog circuitry, noise on the power supply pins degrade device performance. For general power plane decoupling, make certain there is at least one tantalum capacitor (~5 to 10  $\mu F$ ) in the general vicinity of this device. Additionally, ensure one or two multi-layer ceramic chip capacitors (0.01 or 0.1  $\mu F$ ) is located as close as possible to the power and ground pins of the device. Make certain to optimize the layout to minimize power and ground inductance and to locate the capacitor as close to the device pins as possible.

### Termination for LVDS Output

Use a 100 $\Omega$  terminating resistor to terminate CLK and CLK# with two parallel differential traces split near the driver; connect the resistors between each pair near the receiver. This is shown in the following figure.

Figure 2. LVDS Output Termination

## Crystal Input Interface

The CY2VC521-2 is designed for use with a 14 pF parallel resonant crystal. This assumes 2 pF of board capacitance on each crystal signal traces, plus 26 pF internally on both the XIN and XOUT pins. The crystal is required to meet the parameters shown in "Crystal Characteristics" on page 4. Because the frequency pulling function is implemented inside the PLL, there are no additional requirements placed on the crystal for pullability.

The design may require external trimming capacitors if the crystal has  $C_L$  greater than 14 pF, depending on the layout.

## VIN Control

Figure 3 shows a typical VCXO control curve for the CY2VC521-2. The conditions are 25°C,  $V_{DD}=3.3V$ , crystal  $C_L=13$  pF, and board capacitance on XIN and XOUT traces of 3.5 pF each. Note that the internal capacitance measured on the XIN and XOUT pins is approximately 26 pF.

In this case the curve is not centered (0 ppm at  $V_{IN}=V_{DD}/2$ ) because the capacitive loading on the crystal is too high, which causes it to oscillate slower than its nominal frequency. When the crystal is capacitively loaded as specified ( $C_L$ ), it oscillates at its specified frequency, and the VCXO control curve is nominally centered. Such changes in the crystal oscillation frequency result in a vertical shift of the curve. The slope and linearity of the curve are independent of the crystal characteristics.

Figure 3. Typical VCXO Control Curve

## Absolute Maximum Conditions

Parameter	Description	Condition	Min	Max	Unit
V <sub>DD</sub>	Supply Voltage		−0.5	4.4	V
V <sub>IN</sub> <sup>[1]</sup>	Input Voltage, DC	Relative to V <sub>SS</sub>	−0.5	V <sub>DD</sub> +0.5	V
T <sub>S</sub>	Temperature, Storage	Non Operating	−65	150	°C
T <sub>J</sub>	Temperature, Junction		−	135	°C
ESD <sub>HBM</sub>	ESD Protection (Human Body Model)	JEDEC STD 22-A114-B	2000	−	V
UL−94	Flammability Rating	At 1/8 in.	V−0		
Θ <sub>JA</sub> <sup>[5]</sup>	Thermal Resistance, Junction to Ambient	0 m/s airflow	84		°C/W
		1 m/s airflow	79		
		2.5 m/s airflow	76		

## Operating Conditions

Parameter	Description	Min	Typ	Max	Unit
$V_{DD}$	Supply Voltage Range	3.15	3.3	3.45	V
$T_{PU}$	Power up time for $V_{DD}$ to reach $V_{DD}(\min)$ . (Ensure power ramp is monotonic.)	0.05	–	500	ms
$T_A$	Ambient Temperature	0	–	70	°C

## Crystal Characteristics

Parameter	Description	Min	Typ	Max	Unit
	Mode of Oscillation	Fundamental			
F	Frequency	–	27	–	MHz
$C_L$	Load Capacitance	–	14	–	pF
ESR	Equivalent Series Resistance	–	–	50	$\Omega$
$C_S$	Shunt Capacitance	–	–	7	pF

## DC Electrical Characteristics

Parameter	Description	Condition	Min	Typ	Max	Unit
$I_{DD}^{[3]}$	Power Supply Current	Outputs on and terminated	–	–	120	mA
$V_{OD}$	LVDS Differential Output Voltage		247	350	454	mV
$\Delta V_{OD}$	LVDS $V_{OD}$ Magnitude Change		-50	–	50	mV
$V_{OS}$	LVDS Offset Output Voltage		1.125	1.25	1.375	mV
$\Delta V_{OS}$	LVDS $V_{OS}$ Magnitude Change		-25	–	25	mV
$V_{IH}$	Input High Voltage, SEL		$0.7 \cdot V_{DD}$	–	–	V
$V_{IL}$	Input Low Voltage, SEL		–	–	$0.3 \cdot V_{DD}$	V
$I_{IH}$	Input High Current, SEL	$SEL = V_{DD}$	–	–	10	$\mu A$
$I_{IL}$	Input Low Current, SEL	$SEL = V_{SS}$	–	–	20	$\mu A$
$C_{IN}^{[5]}$	Input Capacitance, SEL		–	4	–	pF
$V_{VIN}$	VIN Input Voltage		0	–	$V_{DD}$	V
$I_{VIN}$	VIN Input Current	$V_{SS} \leq VIN \leq V_{DD}$	-10	–	60	$\mu A$
$INL_{VIN}^{[4, 5]}$	VIN to $F_{OUT}$ Integral Nonlinearity	$V_{SS} \leq VIN \leq V_{DD}$	–	1	–	%

### Notes

- The voltage on any input or output pin cannot exceed the power pin during power up.
- Simulated using Apache Sentinel TI software. The board is derived from the JEDEC multilayer standard. It measures 76 x 114 x 1.6 mm and has 4-layers of copper (2/1/1/2 oz.). The internal layers are 100% copper planes, while the top and bottom layers have 50% metalization. No vias are included in the model.
- $I_{DD}$  includes ~8 mA of current that is dissipated externally in the output termination resistors.
- Not 100% tested, guaranteed by design and characterization.
- Integral nonlinearity is defined in IEEE Standard 1241-2000.

**AC Electrical Characteristics**<sup>[4, 6]</sup>

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
F <sub>OUT</sub>	Output Frequency		–	216	–	MHz
PR	Pull Range	V <sub>IN</sub> = V <sub>DD</sub> to V <sub>SS</sub> , relative to frequency at V <sub>IN</sub> = 1.65V, across operating temperature and voltage range	±115	–	–	ppm
T <sub>R</sub> , T <sub>F</sub> <sup>[7]</sup>	Output Rise and Fall Times	20% and 80% of swing between steady state levels	–	–	0.5	ns
T <sub>J</sub>	Period Jitter, RMS		–	7	–	ps
T <sub>Jitter(φ)</sub>	RMS Phase Jitter (Random)	216 MHz carrier, integrated 12 kHz–20 MHz	–	1.3	–	ps
