Functional Description

The CY7C106D ^[1] and CY7C1006D ^[1] are high-performance CMOS static RAMs organized as 262,144 words by 4 bits. Easy

memory expansion is provided by an active LOW Chip Enable (\overline{CE}), an active LOW Output Enable (\overline{OE}), and tri-state drivers. These devices have an automatic power-down feature that reduces power consumption by more than 65% when the devices are deselected. The four input and output pins (IO_0 through IO_3) are placed in a high-impedance state when:

- Deselected (\overline{CE} HIGH)
- Outputs are disabled (\overline{OE} HIGH)
- When the write operation is active (\overline{CE} and \overline{WE} LOW)

Write to the device by taking Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. Data on the four IO pins (IO_0 through IO_3) is then written into the location specified on the address pins (A_0 through A_{17}).

Read from the device by taking Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW while forcing Write Enable (\overline{WE}) HIGH. Under these conditions, the contents of the memory location specified by the address pins appears on the four IO pins.

Both CY7C106D and CY7C1006D devices are suitable for interfacing with processors that have TTL I/P levels. They are not suitable for processors that require CMOS I/P levels. Please see [Electrical Characteristics on page 4](#) for more details and suggested alternatives.

t_{LZWE}	\overline{WE} HIGH to Low Z ^[13]	3	–	ns
t_{HZWE}	\overline{WE} LOW to High Z ^[12, 13]	–	5	ns

Notes

10. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
11. t_{POWER} gives the minimum amount of time that the power supply should be at typical V_{CC} values until the first memory access can be performed.
12. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (c) of [AC Test Loads and Waveforms](#) on page 5. Transition is measured when the outputs enter a high impedance state.
13. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
14. This parameter is guaranteed by design and is not tested.
15. The internal write time of the memory is defined by the overlap of \overline{CE} and \overline{WE} LOW. \overline{CE} and \overline{WE} must be LOW to initiate a write, and the transition of either of these signals can terminate the write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the write.
16. The minimum write cycle time for Write Cycle No. 3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

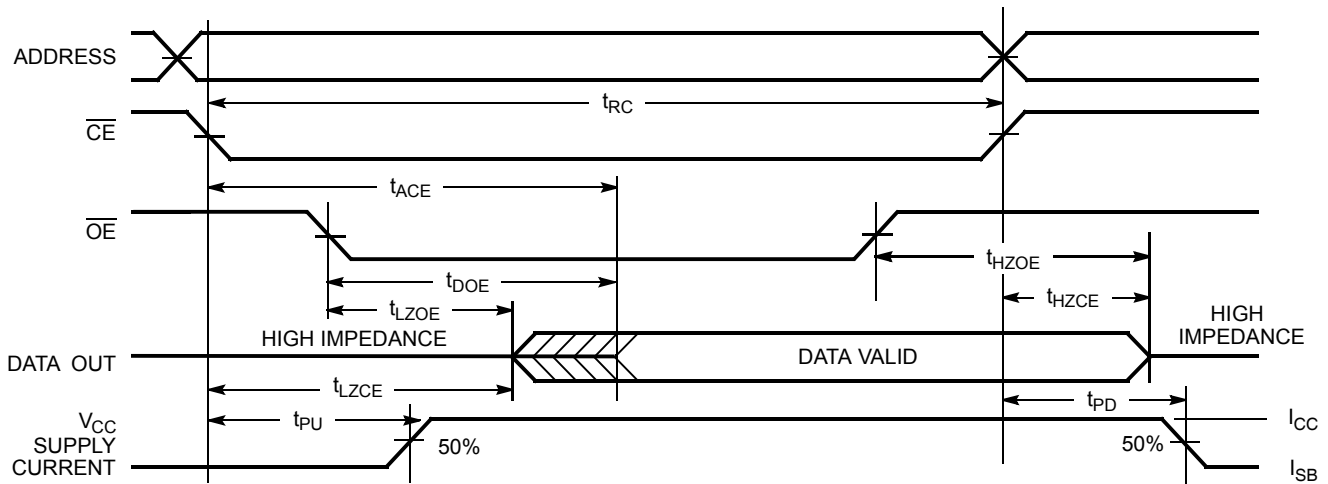

Figure 5. Read Cycle No. 2 (\overline{OE} Controlled) [18, 19]

Notes

17. Device is continuously selected, \overline{OE} and $\overline{CE} = V_{IL}$.
18. \overline{WE} is HIGH for read cycle.
19. Address valid prior to or coincident with \overline{CE} transition LOW.

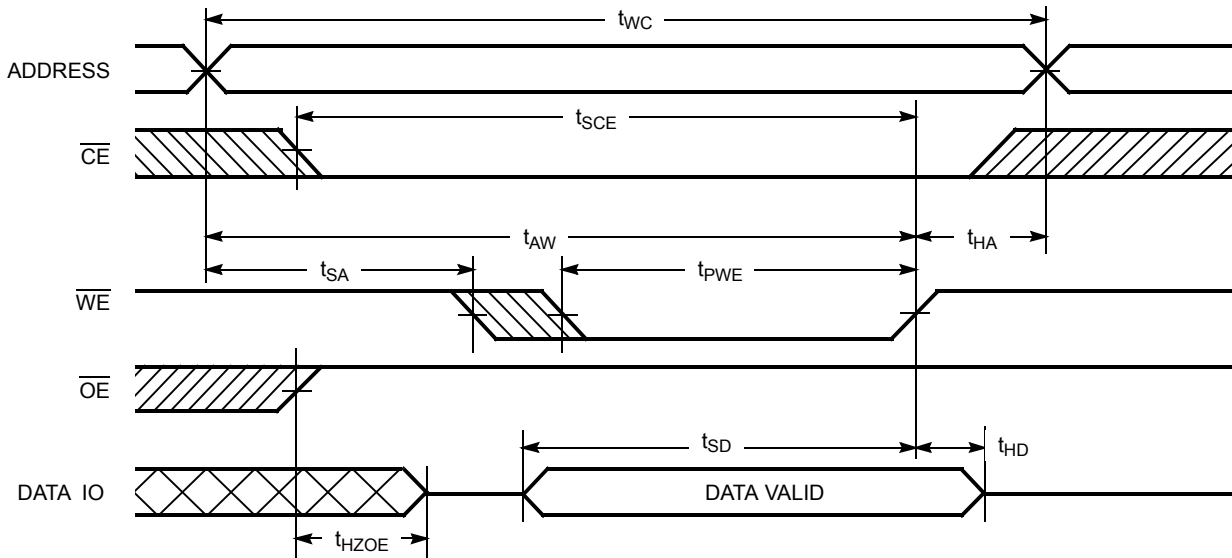

Figure 7. Write Cycle No. 2 ($\overline{\text{WE}}$ Controlled, $\overline{\text{OE}}$ HIGH During Write) [20, 21]

Notes

- 20. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}}$ going HIGH, the output remains in a high-impedance state.
- 21. Data IO is high impedance if $\overline{\text{OE}} = V_{IH}$.

Switching Waveforms (continued)

Figure 8. Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW) [22, 23]

Notes

- 22. The minimum write cycle time for Write Cycle No. 3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .
- 23. Data IO is high impedance if $\overline{OE} = V_{IH}$.
