

TrueTouch™ Multi-Touch Gesture Touchscreen Controller

Features

- TrueTouch™ Capacitive Touchscreen Controller
 - Supports Single-Touch and Multi-Touch Applications
 - Supports up to 24 X/Y Sensor Inputs
 - Supports Screen Sizes 4.3" and Below (Typical)
 - Fast Scan Rates: Typical 0.5 ms per Sensor
 - High Resolution: Typical 320 x 240 for 2.6" Screen
 - Available in 32-Pin QFN Package
- Highly Configurable Sensing Circuitry
 - Allows Maximum Design Flexibility
 - Allows Trade-Off Between Scan Time and Noise Performance
- Includes Gesture Detection Library
- Allows Development of Customized Gestures
- Provides Maximum EMI Immunity
 - Selectable Spread-Spectrum Clock Source
- Low Power TrueTouch Single-Touch Touchscreen Device
 - 4 mA Average Supply Current at 8 ms Report Rate
 - 2 mA Average Supply Current at 16 ms Report Rate
- Powerful Harvard Architecture Processor
 - M8C Processor Speeds to 24 MHz
 - Low Power at High Speed
 - 2.7V to 5.25V Operating Voltage
 - Industrial Temperature Range: -40°C to +85°C
- Flexible On-Chip Memory
 - 8K Flash Program Storage, 50000 Erase/Write Cycles
 - 512 Bytes SRAM Data Storage
 - In-System Serial Programming (ISSP™)
 - Partial Flash Updates
 - Flexible Protection Modes
 - EEPROM Emulation in Flash
- Complete Development Tools
 - Free Development Software (PSoC Designer™)
 - TrueTouch Touchscreen Tuner
 - Full-Featured, In-Circuit Emulator and Programmer
 - Full Speed Emulation
 - Complex Breakpoint Structure
 - 128K Trace Memory
- Precision, Programmable Clocking
 - Internal ±2.5% 24 and 48 MHz Oscillator
 - Internal Oscillator for Watchdog and Sleep
- Programmable Pin Configurations
 - 25 mA Sink, 10 mA Drive on All GPIO
 - Pull Up, Pull Down, High Z, Strong, or Open Drain Drive Modes on All GPIO
 - Up to 8 Analog Inputs on GPIO
 - Configurable Interrupt on All GPIO
- Additional System Resources
 - I²C™ Master, Slave, and Multi-Master to 400 kHz
 - Watchdog and Sleep Timers
 - User-Configurable Low Voltage Detection
 - Integrated Supervisory Circuit
 - On-Chip Precision Voltage Reference

TrueTouch Functional Overview

The TrueTouch family provides the fastest and most efficient way to develop and tune a capacitive touchscreen application. A TrueTouch device includes the configurable TrueTouch block, configurable analog and digital logic, and programmable interconnect. This architecture enables the user to create flexible, customized touchscreen configurations to match the requirements of each individual touchscreen application. Various configurations of Flash program memory, SRAM data memory, and configurable IO are included in a range of convenient pinouts.

The TrueTouch architecture consists of four main areas: the Core, the System Resources, the Digital System, and the TrueTouch Analog System. Configurable global bus resources allow combining all the device resources into a complete custom touchscreen system. Each CY8TMG110 TrueTouch device includes four digital blocks and the TrueTouch controller block. The CY8CTMG110 is offered in a 32-pin QFN package, with up to 28 general purpose IO (GPIO), and support of up to 24 X/Y sensors.

When designing touchscreen applications, refer to the UM data sheet for performance requirements to meet and detailed design process explanation.

The TrueTouch Core

The core encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and IMO (Internal Main Oscillator) and ILO (Internal Low speed Oscillator). The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a four MIPS 8-bit Harvard architecture microprocessor.

System Resources provide the following additional capabilities:

- Digital clocks to increase the flexibility of the PSoC mixed-signal arrays.
- I2C functionality to implement an I2C master and slave.
- An internal voltage reference, MultiMaster, that provides an absolute value of 1.3V to a number of TrueTouch subsystems.
- Various system resets supported by the M8C.

The Digital System consists of an array of digital blocks that may be configured into any number of digital peripherals. The digital blocks are connected to the GPIO through a series of global buses that can route any signal to any pin, freeing designs from the constraints of a fixed peripheral controller.

The Analog System consists of four analog blocks, supporting comparators and analog-to-digital conversion up to 8 bits in precision.

Implementation of touchscreen applications allows additional digital and analog resources to be used, depending on the touchscreen design.

The Digital System

The Digital System consists of 4 digital PSoC blocks. Each block is an 8-bit resource that is used alone or combined with other blocks to form 8, 16, 24, and 32-bit peripherals, which are called user module references. Digital peripheral configurations include the following.

- PWMs (8 to 32 bit)
- PWMs with Dead band (8 to 32 bit)
- Counters (8 to 32 bit)
- Timers (8 to 32 bit)
- UART 8 bit with selectable parity
- SPI master and slave
- I2C slave and multi-master
- Pseudo Random Sequence Generators (8 to 32 bit)

The digital blocks are connected to any GPIO through a series of global buses that can route any signal to any pin. The buses also allow signal multiplexing and performing logic operations. This configurability frees your designs from the constraints of a fixed peripheral controller.

Digital blocks are provided in rows of four, where the number of blocks varies by PSoC device family. This allows the optimum choice of system resources for your application. Family characteristics are shown in Table 1 on page 4.

Figure 1. Digital System Block Diagram

The Analog System

The Analog System consists of 4 configurable blocks that allow the creation of complex analog signal flows. Analog peripherals are very flexible and may be customized to support specific application requirements. Some of the common PSoC analog functions for this device (most available as user modules) are:

- Analog-to-digital converters (single or dual, with 8-bit resolution)
- Pin-to-pin comparator
- Single-ended comparators (up to 2) with absolute (1.3V) reference or 8-bit DAC reference
- 1.3V reference (as a System Resource)

Figure 2. Analog System Block Diagram

The Analog Multiplexer System

The Analog Mux Bus connects to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for capacitive sensing with the TrueTouch block comparator. An additional 8:1 analog input multiplexer provides a second path to bring Port 0 pins to the analog array.

Switch control logic enables selected pins to switch dynamically under hardware control. This allows capacitive measurement for the touchscreen application. Other multiplexer applications include:

- Chip-wide mux that allows analog input from any IO pin.
- Electrical connection between any IO pin combinations.

Additional System Resources

System Resources, some of which are listed in the previous sections, provide additional capability useful to complete systems. Additional resources include low voltage detection and power on reset. Brief statements describing the merits of each system resource follow.

- Digital clock dividers provide three customizable clock frequencies for use in applications. The clocks may be routed to both the digital and analog systems. Additional clocks can be generated using digital PSoC blocks as clock dividers.
- The I2C module provides 100 and 400 kHz communication over two wires. Slave, master, and multi-master modes are all supported.
- Low Voltage Detection (LVD) interrupts can signal the application of falling voltage levels, while the advanced POR (Power On Reset) circuit eliminates the need for a system supervisor.
- An internal 1.3 voltage reference provides an absolute reference for the analog system, including ADCs and DACs.
- Versatile analog multiplexer system.

Getting Started

To understand the TrueTouch device, read this data sheet and use the PSoC Designer™ Integrated Development Environment (IDE). This data sheet is an overview of the general silicon information and electrical specifications. For in depth touchscreen application information, including touchscreen specific specifications, read the touchscreen user module data sheet that is supported by this specific device.

TrueTouch Device Characteristics

Depending on your TrueTouch device selected for a touchscreen application, characteristics and capabilities of each device changes. Table 1 lists the touchscreen sensing capabilities available for specific TrueTouch devices. The TrueTouch device covered by this data sheet is highlighted in this table.

Table 1. TrueTouch Device Characteristics

TrueTouch Part Number	Sensor Inputs	Max Screen Size (Inches)	Single-Touch	Multi-Touch Gesture	Multi-Touch All-Point	Scan Speed (ms) ^[1]	Current Consumption ^[2]	Flash Size	SRAM Size
CY8CTST110	up to 24	4.3"	Y	N	N	0.5	3	8K	512 Bytes
CY8CTST120	up to 44	8.4"	Y	N	N	0.5	16	16K	1K

CY8CTMA120	up to 37	7.3"	Y	Y	Y	0.12	16	16K	1K

Notes

1. Per sensor typical. Depends on touchscreen panel. For MA120 per X/Y crossing Vcc = 3.3V.
2. Average mA supply current. Based on 8 ms report rate, except for MA120.

Development Kits

Development Kits are available from the following distributors: Digi-Key, Avnet, Arrow, and Future. The Cypress Online Store contains development kits, C compilers, and all accessories for PSoC development. Go to the Cypress Online Store web site at <http://www.cypress.com>, click the Online Store shopping cart icon at the bottom of the web page, and click *PSoC (Programmable System-on-Chip)* to view a current list of available items.

Technical Training Modules

Free PSoC technical training modules are available for users new to PSoC. Training modules cover designing, debugging, advanced analog, and CapSense. Go to <http://www.cypress.com/training>.

Consultants

Certified PSoC Consultants offer everything from technical assistance to completed PSoC designs. To contact or become a PSoC Consultant go to <http://www.cypress.com>, click on Design Support located on the left side of the web page, and select CYPros Consultants.

Technical Support

PSoC application engineers take pride in fast and accurate response. They are available with a four hour guaranteed response at <http://www.cypress.com/support>.

Application Notes

A long list of application notes can assist you in every aspect of your design effort. To view the PSoC application notes, go to the <http://www.cypress.com> web site and select Application Notes under the Design Resources list located in the center of the web page. Application notes are sorted by date by default.

Development Tools

PSoC Designer is a Microsoft® Windows based, integrated development environment for the Programmable System-on-Chip (PSoC) devices. The PSoC Designer IDE and application runs on Windows NT 4.0, Windows 2000, Windows Millennium (Me), or Windows XP (see Figure 3 on page 5).

PSoC Designer helps the customer to select an operating configuration for the PSoC, write application code that uses the PSoC, and debug the application. This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and the CYASM macro assembler for the CPUs.

PSoC Designer also supports a high level C language compiler developed specifically for the devices in the family.

Figure 3. PSoC Designer Subsystems

TrueTouch Designer Software Subsystems

Device Editor

The device editor subsystem enables the user to select different onboard analog and digital components called user modules using the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic reconfiguration allows changing configurations at run time.

PSoC Designer sets up power on initialization tables for selected PSoC block configurations and creates source code for an application framework. The framework contains software to operate the selected components. If the project uses more than one operating configuration, then it contains routines to switch between different sets of PSoC block configurations at run time. PSoC Designer prints out a configuration sheet for a given project configuration for use during application programming in conjunction with the device data sheet. After the framework is generated, the user adds application-specific code to flesh out the framework. It is also possible to change the selected components and regenerate the framework.

Design Browser

The Design Browser enables users to select and import preconfigured designs into the user’s project. Users can easily browse a catalog of preconfigured designs to facilitate time-to-design. Examples provided in the tools include a

300-baud modem, LIN Bus master and slave, fan controller, and magnetic card reader.

Application Editor

The Application Editor edits the C language and assembly language source code. It also assembles, compiles, links, and builds.

Assembler. The macro assembler allows the seamless merging of the assembly code with C code. The link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compiler. A C language compiler that supports the PSoC family of devices is available. Even if you have never worked in the C language before, the product quickly helps you create complete C programs for the PSoC family devices.

The embedded, optimizing C compiler provides all the features of C tailored to the PSoC architecture. It comes complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing the designer to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read the program and read and write data memory, read and write IO registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system displays online, context-sensitive help for the user. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

Hardware Tools

In-Circuit Emulator

A low cost, high functionality ICE (In-Circuit Emulator) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full speed (24 MHz) operation.

TrueTouch Touchscreen Tuner

The TrueTouch tuner is a Microsoft® Windows based graphical user interface allowing developers to set critical parameters and observe changes to the touchscreen application in real time. Optimal configuration from the tuner can be immediately applied to the TrueTouch user module settings.

Designing with User Modules

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC blocks. They implement a wide variety of user selectable functions. Each block has several registers that determine its function and connectivity to other blocks, multiplexers, buses and to the IO pins. Iterative development cycles permit you to adapt the hardware and the software. This substantially lowers the risk of selecting a different part to meet the final design requirements.

To speed the development process, the PSoC Designer IDE provides a library of pre-built, pre-tested hardware peripheral functions, called "User Modules." User modules make selecting and implementing peripheral devices simple. They come in analog, digital, and mixed signal varieties. The standard user module library contains over 50 common peripherals such as ADCs, DACs, timers, counters, UARTs, and other uncommon peripherals, such as DTMF Generators and Bi-Quad analog filter sections.

Each user module establishes the basic register settings to implement the selected function. It also provides parameters that allow you to tailor its precise configuration to a particular application. For example, a Pulse Width Modulator User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit to establish the pulse width and duty cycle. User modules also provide tested software to cut your development time. The user module application programming interface (API) provides high level functions to control and respond to hardware events at run time. The API also provides optional interrupt service routines to adapt as needed.

The API functions are documented in user module data sheets that are viewed directly in the PSoC Designer IDE. These data sheets explain the internal operation of the user module and provide performance specifications. Each data sheet describes the use of each user module parameter and documents the setting of each register controlled by the user module.

The development process starts when you open a new project and bring up the Device Editor, a graphical user interface (GUI) for configuring the hardware. Select the user modules you need for your project and map them onto the PSoC blocks with point-and-click simplicity. Next, you build signal chains by inter-connecting user modules to each other and the IO pins. At this stage, also configure the clock source connections and enter parameter values directly or by selecting values from drop down menus. When you are ready to test the hardware configuration or move on to developing code for the project, perform the "Generate Application" step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the high level user module API functions.

Figure 4. User Module and Source Code Development Flows

The next step is to write your main program, and any sub-routines using PSoC Designer's Application Editor subsystem. The Application Editor includes a Project Manager that allows you to open the project source code files (including all generated code files) from a hierarchal view. The source code editor provides syntax coloring and advanced edit features for both C and assembly language. File search capabilities include simple string searches and recursive "grep-style" patterns. A single mouse click invokes the Build Manager. It employs a professional-strength "makefile" system to automatically analyze all file dependencies and run the compiler and assembler as necessary. Project-level options control optimization strategies used by the compiler and linker. Syntax errors are displayed in a console window. Double click the error message to show the offending line of source code. When all is correct, the linker builds a HEX file image suitable for programming.

The last step in the development process takes place inside the PSoC Designer's Debugger subsystem. The Debugger downloads the HEX image to the In-Circuit Emulator (ICE) where it runs at full speed. Debugger capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the Debugger provides a large trace buffer. This enables to define complex breakpoint events such as monitoring address and data bus values, memory locations, and external signals.

Units of Measure

A units of measure table is located in the Electrical Specifications section. [Table 4](#) on page 12 lists all the abbreviations used to measure the PSoC devices.

Numeric Naming

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers are also represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h', 'b', or 0x are decimal.

Pinouts

The CY8CTMG110 TrueTouch device is available in a 32-pin QFN package which is listed in the following tables. Every port pin (labeled with a “P”) is capable of Digital IO and connection to the common analog bus. However, Vss, Vdd, SMP, and XRES are not capable of Digital IO.

Flash _{DR}	Flash Data Retention	10	–	–	Years	

Note

11. A maximum of 36 x 50,000 block endurance cycles is allowed. This may be balanced between operations on 36x1 blocks of 50,000 maximum cycles each, 36x2 blocks of 25,000 maximum cycles each, or 36x4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36x50,000 and that no single block ever sees more than 50,000 cycles).
 For the full industrial range, the user must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to the Flash APIs Application Note AN2015 at <http://www.cypress.com> under Application Notes for more information.

T _{WRITE}	Flash Block Write Time	–	30	–	ms	
T _{DSCLK}	Data Out Delay from Falling Edge of SCLK	–	–	45	ns	3.6 < V _{dd}
T _{DSCLK3}	Data Out Delay from Falling Edge of SCLK	–	–	50	ns	3.0 ≤ V _{dd} ≤ 3.6
T _{DSCLK2}	Data Out Delay from Falling Edge of SCLK	–	–	70	ns	2.4 ≤ V _{dd} ≤ 3.0

AC I²C Specifications

Table 31 and Table 32 list the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75V to 5.25V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, 3.0V to 3.6V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, or 2.4V to 3.0V and $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, respectively. Typical parameters apply to 5V, 3.3V, or 2.7V at 25°C. These are for design guidance only.

Table 31. AC Characteristics of the I²C SDA and SCL Pins for V_{dd} ≥ 3.0V

Symbol	Description	Standard Mode		Fast Mode		Units
		Min	Max	Min	Max	
F _{SCL12C}	SCL Clock Frequency	0	100	0	400	kHz
T _{HDSTA12C}	Hold Time (repeated) START Condition. After this period, the first clock pulse is generated.	4.0	–	0.6	–	μs
T _{LOW12C}	LOW Period of the SCL Clock	4.7	–	1.3	–	μs
T _{HIGH12C}	HIGH Period of the SCL Clock	4.0	–	0.6	–	μs
T _{SUSTA12C}	Set-up Time for a Repeated START Condition	4.7	–	0.6	–	μs
T _{HDDAT12C}	Data Hold Time	0	–	0	–	μs
T _{SUDAT12C}	Data Set-up Time	250	–	100 ^[20]	–	ns
T _{SUSTOI2C}	Set-up Time for STOP Condition	4.0	–	0.6	–	μs
T _{BUF12C}	Bus Free Time Between a STOP and START Condition	4.7	–	1.3	–	μs
T _{SPI2C}	Pulse Width of Spikes are Suppressed by the Input Filter.	–	–	0	50	ns

Note

20. A Fast-Mode I²C-bus device may be used in a Standard-Mode I²C-bus system, but the requirement $t_{\text{SU:DAT}} \geq 250$ ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{\text{max}} + t_{\text{SU:DAT}} = 1000 + 250 = 1250$ ns (according to the Standard-Mode I²C-bus specification) before the SCL line is released.

Table 32. 2.7V AC Characteristics of the I²C SDA and SCL Pins (Fast Mode not Supported)

Symbol	Description	Standard Mode		Fast Mode		Units
		Min	Max	Min	Max	
F _{SCLi2C}	SCL Clock Frequency	0	100	–	–	kHz
T _{HDSTAI2C}	Hold Time (repeated) START Condition. After this period, the first clock pulse is generated.	4.0	–	–	–	μs
T _{LOWI2C}	LOW Period of the SCL Clock	4.7	–	–	–	μs

Packaging Information

This section shows the packaging specifications for the CY8CTMG110 TrueTouch device with the thermal impedances for each package.

It is important to note that emulation tools may require a larger area on the target PCB than the chip's footprint. For a detailed description of the emulation tools' dimensions, refer to the document titled *PSoC Emulator Pod Dimensions* at <http://www.cypress.com/design/MR10161>.

For information on the preferred dimensions for mounting QFN packages, see the following Application Note at http://www.amkor.com/products/notes_papers/MLFAppNote.pdf.

Thermal Impedances

Table 33. Thermal Impedances per Package

Package	Typical θ_{JA} [21]	Typical θ_{JC}
32 QFN ^[21] 5x5 mm 0.93 MAX	22 °C/W	12 °C/W

Solder Reflow Peak Temperature

Following is the minimum solder reflow peak temperature to achieve good solderability.

Table 34. Solder Reflow Peak Temperature

Package	Minimum Peak Temperature ^[23]	Maximum Peak Temperature
32 QFN	240°C	260°C

Notes

21. $T_J = T_A + \text{Power} \times \theta_{JA}$.

22. To achieve the thermal impedance specified for the ** package, the center thermal pad is soldered to the PCB ground plane.

23. Higher temperatures is required based on the solder melting point. Typical temperatures for solder are 220 ± 5oC with Sn-Pb or 245 ± 5oC with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Development Tool Selection

Software

PSoC Designer

At the core of the PSoC development software suite is PSoC Designer. Used by thousands of PSoC developers, this robust software has been facilitating PSoC designs for half a decade. PSoC Designer is available free of charge at <http://www.cypress.com> under Design Resources > Software and Drivers.

PSoC Programmer

Flexible enough to be used on the bench in development, yet suitable for factory programming, PSoC Programmer works either as a standalone programming application or operates directly from PSoC Designer or PSoC Express. PSoC Programmer software is compatible with both PSoC ICE-Cube In-Circuit Emulator and PSoC MiniProg. PSoC programmer is available free of charge at <http://www.cypress.com/psocprogrammer>.

Hi-Tech C Lite Compiler

Hi-Tech C Lite is an ANSI C compiler optimized for PSoC to deliver dense, efficient executable code for a smaller-than-ever footprint. Hi-Tech C Lite can be downloaded at <http://www.cypress.htsoft.com>. To install the HI-TECH Lite version, download the compiler installation file from HI-TECH and choose the Lite option when prompted for a registration key. The Lite version can be upgraded to the 45-day full featured evaluation version or the PRO version at any time, however the PRO version can only be enabled with a purchased registration key.

Hi-Tech C Pro Compiler

Hi-Tech C Pro is an optional upgrade to PSoC Designer that offers all of the benefits of Hi-Tech C Lite with additional features. Hi-Tech C Pro is available for purchase either at the Cypress Online Store or at <http://www.cypress.htsoft.com>. Hi-Tech C Pro is recommended for touchscreen applications using the Multi-Touch All-Point CY8CTMA120 device.

CY3202-C iMAGEcraft C Compiler

CY3202 is the optional upgrade to PSoC Designer that enables the iMAGEcraft C compiler. It can be purchased from the Cypress Online Store. At <http://www.cypress.com>, click the Online Store shopping cart icon at the bottom of the web page, and click *PSoC (Programmable System-on-Chip)* to view a current list of available items.

Evaluation Tools

All evaluation tools can be purchased from the Cypress Online Store.

CY3210-MiniProg1

The CY3210-MiniProg1 kit allows a user to program PSoC devices through the MiniProg1 programming unit. The MiniProg is a small, compact prototyping programmer that connects to the PC through a provided USB 2.0 cable. The kit includes:

- MiniProg Programming Unit
- MiniEval Socket Programming and Evaluation Board
- 28-Pin CY8C29466-24PXI PDIP PSoC Device Sample
- 28-Pin CY8C27443-24PXI PDIP PSoC Device Sample
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

Device Programmers

All device programmers can be purchased from the Cypress Online Store.

CY3216 Modular Programmer

The CY3216 Modular Programmer kit features a modular programmer and the MiniProg1 programming unit. The modular programmer includes three programming module cards and supports multiple Cypress products. The kit includes:

- Modular Programmer Base
- 3 Programming Module Cards
- MiniProg Programming Unit
- PSoC Designer Software CD
- Getting Started Guide
- USB 2.0 Cable

CY3207ISSP In-System Serial Programmer (ISSP)

The CY3207ISSP is a production programmer. It includes protection circuitry and an industrial case that is more robust than the MiniProg in a production-programming environment.

Note CY3207ISSP needs special software and is not compatible with PSoC Programmer. The kit includes:

- CY3207 Programmer Unit
- PSoC ISSP Software CD
- 110 ~ 240V Power Supply, Euro-Plug Adapter
- USB 2.0 Cable

Accessories (Emulation and Programming)

Third Party Tools

Several tools have been specially designed by the following third party vendors to accompany PSoC devices during development and production. Specific details for each of these tools can be found at <http://www.cypress.com> under Design Resources > Evaluation Boards.

Build a PSoC Emulator into Your Board

For details on how to emulate your circuit before going to volume production using an on-chip debug (OCD) non-production PSoC device, see application note [AN2323](#) "Debugging - Build a PSoC Emulator into Your Board".
