16-bit Proprietary Microcontroller

CMOS

F²MC-16F MB90220 Series

MB90223/224/P224A/W224A MB90P224B/W224B/V220

■ OUTLINE

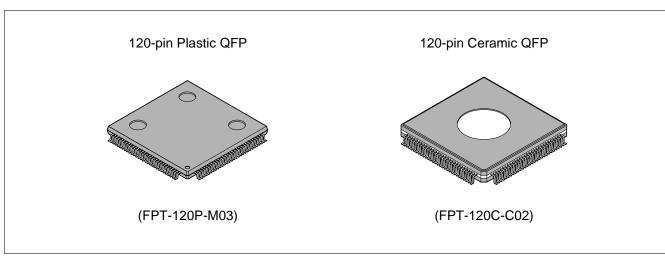

The MB90220 series of general-purpose high-performance 16-bit microcontrollers has been developed primarily for applications that demand high-speed real-time processing and is suited for industrial applications, office automation equipment, process control, and other applications. The F²MC-16F CPU is based on the F²MC*-16 Family with improved high-level language support functions and task switching functions, as well as additional addressing modes.

On-chip peripheral resources include a 4-channel PWC timer, a 4-channel ICU (Input Capture Unit), a 1-channel 24-bit timer counter, an 8-channel OCU (Output Compare Unit), a 6-channel 16-bit reload timer, a 2-channel 16-bit PPG timer, a 10-bit A/D converter with 16 inputs, and a 4-channel serial port with a UART function (one channel includes the CTS function).

The MB90P224B, MB90W224B, MB90224 is under development.

*: F2MC stands for FUJITSU Flexible Microcontroller.

■ PACKAGE

■ FEATURES

F²MC-16F CPU

- Minimum execution time: 62.5 ns/16 MHz oscillation (using a duty control system)
- · Instruction sets optimized for controllers

Upward object-compatible with the F²MC-16(H)

Various data types (bit, byte, word, and long-word)

Instruction cycle improved to speed up operation

Extended addressing modes: 25 types

High coding efficiency

Access method (bank access with linear pointer)

Enhanced multiplication and division instructions (with signed instructions added)

Higher-precision operation using a 32-bit accumulator

• Extended intelligent I/O service (automatic transfer function independent of instructions)

Access area expanded to 64 Kbytes

· Enhanced instruction set applicable to high-level language (C) and multitasking

System stack pointer

Enhanced pointer-indirect instructions

Barrel shift instruction

Stack check function

- Increased execution speed: 8-byte instruction queue
- Powerful interrupt functions: 8 levels and 28 sources

Peripheral resources

• Mask ROM : 64 Kbytes (MB90223)

96 Kbytes (MB90224)

EPROM : 96 Kbytes (MB90W224A/W224B)One-time PROM : 96 Kbytes (MB90P224A/P224B)

RAM: 3 Kbytes (MB90223)

4.5 Kbytes (MB90224/MB90W224A/P224A/W224B/P224B)

5 Kbytes (MB90V220)

- General-purpose ports: max. 102 channels
- ICU (Input Capture Unit): 4 channels
- 24-bit timer counter: 1 channel
- OCU (Output Compare Unit): 8 channels
- PWC timer with time measurement function: 4 channels
- 10-bit A/D converter: 16 channels
- UART: 4 channels (one channel includes CTS function)
- 16-bit reload timer

Toggled output, external clock, and gate functions: 6 channels

- 16-bit PPG timer: 2 channels
- DTP/External-interrupt inputs: 8 channels (of which five have edge detection function only)
- Write-inhibit RAM: 0.5 Kbytes (1 Kbyte for MB90V220)
- Timebase counter: 18 bits
- Clock gear function
- Low-power consumption mode

Sleep mode

Stop mode

Hardware standby mode

Product description

- MB90223/224 are mask ROM product.
- MB90P224A/P224B are one-time PROM products.
- MB90W224A/W224B are EPROM products. ES only.
- Operating temperature of MB90P224A/W224A is -40°C to +85°C. (However, the AC characteristics is assured in -40°C to +70°C)
- Operation clock cycle of MB90223 is 10 MHz to 12 MHz.
- MB90V220 is a evaluation device for the program development. ES only.

■ PIN ASSIGNMENT

■ PIN DESCRIPTION

Pin no.		Circuit	
QFP*	Pin name	type	Function
92, 93	X0, X1	А	Crystal oscillation pins (16 MHz)
89 to 87	MD0 to MD2	D	Operation mode specification input pins Connect directly to Vcc or Vss.
90	RST	G	External reset request input
86	HST	Е	Hardware standby input pin
95 to 102	P00 to P07	С	General-purpose I/O ports This function is valid only in single-chip mode.
	D00 to D07		Output pins for low-order 8 bits of the external address bus. This function is valid only in modes where the external bus is enabled.
103 to 110	P10 to P17	С	General-purpose I/O ports This function is valid only in single-chip mode or when the external bus is enabled and the 8-bit data bus specification has been made.
	D08 to D15		I/O pins for higher-order 8 bits of the external data bus This function is valid only when the external bus is enabled and the 16-bit bus specification has been made.
111 to 118	P20 to P27	С	General-purpose I/O ports This function is valid only in single-chip mode.
	A00 to A07		Output pins for lower-order 8 bits of the external address bus This function is valid only in modes where the external bus is enabled.
120, 1 to 7	P30, P31 to P37	С	General-purpose I/O ports This function is valid either in single-chip mode or when the address mid-order control register specification is "port".
	A08, A09 to A15		Output pins for mid-order 8 bits of the external address bus This function is valid in modes where the external bus is enabled and the address mid-order control register specification is "address".
9 to 11	P40 to P42	С	General-purpose I/O ports This function is valid either in single-chip mode or when the address high-order control register specification is "port".
	A16 to A18		Output pins for higher-order 8 bits of the external address bus This function is valid in modes where the external bus is enabled and the address high-order control register specification is "address".
12 to 16	P43 to P47	С	General-purpose I/O ports This function is valid when either single-chip mode is enabled or the address higher-order control register specification is "port".
	A19 to A23		Output pins for higher-order 8 bits of the external address bus This function is valid in modes where the external bus is enabled and the address higher-order control register specification is "address".
	TIN1 to TIN5		16-bit reload timer input pins This function is valid when the timer input specification is "enabled". The data on the pins is read as timer input (TIN1 to TIN5).

^{*:} FPT-120P-M03, FPT-120C-C02

Pin no. QFP*	Pin name	Circuit type	Function
12 to 16	INT3 to INT7	С	External interrupt request input pins When external interrupts are enabled, these inputs may be used suddenly at any time; therefore, it is necessary to stop output by other functions on these pins, except when using them for output deliberately.
78	P50	С	General-purpose I/O port This function is valid in single-chip mode and when the CLK output specification is disabled.
	CLK		CLK output pin This function is valid in modes where the external bus is enabled and the CLK output specification is enabled.
79	P51	С	General-purpose I/O port This function is valid in single-chip mode or when the ready function is disabled.
	RDY		Ready input pin This function is valid in modes where the external bus is enabled and the ready function is enabled.
80	P52	С	General-purpose I/O port This function is valid in single-chip mode or when the hold function is disabled.
	HAK		Hold acknowledge output pin This function is valid in modes where the external bus is enabled and the hold function is enabled.
81	P53	С	General-purpose I/O port This function is valid in single-chip mode or external bus mode and when the hold function is disabled.
	HRQ		Hold request input pin This function is valid in modes where the external bus is enabled and the hold function is enabled. During this operation, the input may be used suddenly at any time; therefore, it is necessary to stop output by other fuctions on this pin, except when using it for output deliberately.
82	P54	С	General-purpose I/O port This function is valid in single-chip mode, when the external bus is in 8-bit mode, or when WRH pin output is disabled.
	WRH		Write strobe output pin for the high-order 8 bits of the data bus This function is valid in modes where the external bus is enabled, the external bus is in 16-bit mode, and WRH pin output is enabled.
83	P55	С	General-purpose I/O port This function is valid in single-chip mode or when \overline{WRL} pin output is disabled.
	WRL		Write strobe output pin for the low-order 8 bits of the data bus This function is valid in modes where the external bus is enabled and WRL pin output is enabled.

^{*:} FPT-120P-M03, FPT-120C-C02

Pin no. QFP*	Pin name	Circuit type	Function
84	P56	С	General-purpose I/O port This function is valid in single-chip mode. This function is valid in modes where the external bus is valid.
	RD		Read strobe output pin for the data bus This function is valid in modes where the external bus is enabled.
85	P57	В	General-purpose I/O port This function is always valid. When these pins are open in input mode, through current may leak in stop mode/reset mode, be sure to fix these pins to Vcc/Vss level to use these pins in input mode.
	WI		RAM write disable request input During this operation, the input may be used suddenly at any time; therefore, it is necessary to stop output by other fuctions on this pin, except when using it for output deliberately.
46 to 53	P60 to P67	F	Open-drain I/O ports This function is valid when the analog input enable register specification is "port".
	AN00 to AN07		10-bit A/D converter analog input pins This function is valid when the analog input enable register specification is "analog input".
17 to 24	P70 to P77	С	General-purpose I/O ports This function is valid when the output specification for DOT0 to DOT7 is "disabled".
	DOT0 to DOT7		This function is valid when OCU (output compare unit) output is enabled.
25 to 30	P80 to P85	С	General-purpose I/O ports This function is valid when the output specification for TOT0 to TOT5 is "disabled".
	TOT0 to TOT5		16-bit reload timer output pins (TOT0 to TOT5)
31, 32	P86, P87	С	General-purpose I/O ports This function is valid when the PPG0, and PPG1 output specification is "disabled".
	PPG0, PPG1		16-bit PPG timer output pins This function is valid when the PPG control/status register specification is "PPG output pins".
34 to 41	P90 to P97	F	Open-drain I/O ports This function is valid when the analog input enable register specification is "port".
	AN08 to AN15		10-bit A/D converter analog input pins This function is valid when the analog input enable register specification is "analog input".

^{*:} FPT-120P-M03, FPT-120C-C02

Pin no.	Pin name	Circuit	Function
QFP*	Fill liallie	type	Function
55	PA0	С	General-purpose I/O port This function is always valid.
	ASR0		ICU (input capture unit) input pin This function is valid during ICU (input capture unit) input operations.
56	PA1	С	General-purpose I/O port This function is always valid.
	PWC0		PWC input pin During PWC0 input operations, this input may be used suddenly at any time; therefore, it is necessary to stop output by other functions on this pin, except when using it for output deliberately.
	POT0		PWC output pin This function is valid during PWC output operations.
57 to 59	PA2 to PA4	С	General-purpose I/O ports This function is always valid.
	PWC1 to PWC3		PWC input pins This function is valid during PWC input operations. During PWC1 to PWC3 input operations, this input may be used suddenly at any time; therefore, it is necessary to stop output by other functions on this pin, except when using it for output deliberately.
	POT1 to POT3		PWC output pins This function is valid during PWC output operations.
	ASR1 to ASR3		ICU (input capture unit) input pins This function is valid during ICU (input capture unit) input operations.
60, 61	PA5, PA6	В	General-purpose I/O ports This function is always valid. When these pins are open in input mode, through current may leak in stop mode/reset mode, be sure to fix these pins to Vcc/Vss level to use these pins in input mode.
	INTO, INT1		DTP/External interrupt request input pins When DTP/external interrupts are enabled, these inputs may be used suddenly at any time; therefore, it is necessary to stop output by other functions on these pins, except when using them for output deliberately. When these pins are open in input mode, through current may leak in stop mode/reset mode, be sure to fix these pins to Vcc/Vss level to use these pins in input mode.
62	PA7	В	General-purpose I/O port This function is always valid. When these pins are open in input mode, through current may leak in stop mode/reset mode, be sure to fix these pins to Vcc/Vss level to use these pins in input mode.

^{*:} FPT-120P-M03, FPT-120C-C02

Pin no.	Pin name	Circuit	Function
QFP*	T III Haine	type	T dilotion
62	INT2	В	DTP/External interrupt request input pin When DTP/external interrupts are enabled, these inputs may be used suddenly at any time; therefore, it is necessary to stop output by other functions on these pins, except when using them for output deliberately. When these pins are open in input mode, through current may leak in stop mode/reset mode, be sure to fix these pins to Vcc/Vss level to use these pins in input mode.
	ĀTG		10-bit A/D converter external trigger input pin When these pins are open in input mode, through current may leak in stop mode/reset mode, be sure to fix these pins to Vcc/Vss level to use these pins in input mode.
64	PB0	С	General-purpose I/O port This function is valid when the UART0 (ch.0) serial data output specification is "disabled".
	SOD0		UART0 (ch.0) serial data output This function is valid when the UART0 (ch.0) serial data output specification is "enabled".
65	PB1	С	General-purpose I/O port This function is always valid.
	SID0		UART0 (ch.0) serial data input pin During UART0 (ch.0) input operations, this input may be used suddenly at any time; therefore, it is necessary to stop output by other functions on this pin, except when using it for output deliberately.
66	PB2	С	General-purpose output port This function is valid when the UART0 (ch.0) clock output specification is "disabled".
	SCK0		UART0 (ch.0) clock output pin The clock output function is valid when the UART0 (ch.0) clock output specification is "enabled". UART0 (ch.0) external clock input pin. This function is valid when the port is in input mode and the UART0 (ch.0) specification is external clock mode.
67	PB3	С	General-purpose I/O port This function is valid when the UART0 (ch.1) serial data output specification is "disabled".
	SOD1		UART0 (ch.1) serial data output pin This function is valid when the UART0 (ch.1) serial data output specification is "enabled".
68	PB4	С	General-purpose I/O port This function is always valid.
	SID1		UART0 (ch.1) serial data input pin During UART0 (ch.1) input operations, this input may be used suddenly at any time; therefore, it is necessary to stop output by other functions on this pin, except when using it for output deliberately.

Pin no.	Pin name	Circuit type	Function
QFP*			
75	PC3	С	General-purpose I/O port This function is valid when the UART1 clock output specification is "disabled".
	SCK3		UART1 clock output pin The clock output function is valid when the UART1 clock output specification is "enabled". UART1 external clock input pin This function is valid when the port is in input mode and the UART1 specification is external clock mode.
76	PC4	С	General-purpose I/O port This function is always valid.
	CTS0		UART0 (ch.0) Clear To Send input pin When the UART0 (ch.0) CTS function is enabled, this input may be used suddenly at any time; therefore, it is necessary to stop output by other functions on this pin, except when using it for output deliberately.
77	PC5	С	General-purpose I/O port This function is always valid.
	TRG0		16-bit PPG timer trigger input pin This function is valid when the 16-bit PPG timer trigger input specification is enabled. The data on this pin is read as 16-bit PPG timer trigger input (TRG0). During this operation, the input may be used suddenly at any time; therefore, it is necessary to stop output by other functions on this pin, except when using it for output deliberately.
8, 54, 94	Vcc	Power supply	Power supply for digital circuitry
33, 63, 91, 119	Vss	Power supply	Ground level for digital circuitry
42	AVcc	Power supply	Power supply for analog circuitry When turning this power supply on or off, always be sure to first apply electric potential equal to or greater than AVcc to Vcc. During normal operation AVcc should be equal to Vcc.
43	AVRH	Power supply	Reference voltage input for analog circuitry When turning this pin on or off, always be sure to first apply electric potential equal to or greater than AVRH to AVcc.
44	AVRL	Power supply	Reference voltage input for analog circuitry
45	AVss	Power supply	Ground level for analog circuitry

^{*:} FPT-120P-M03, FPT-120C-C02

■ I/O CIRCUIT TYPE

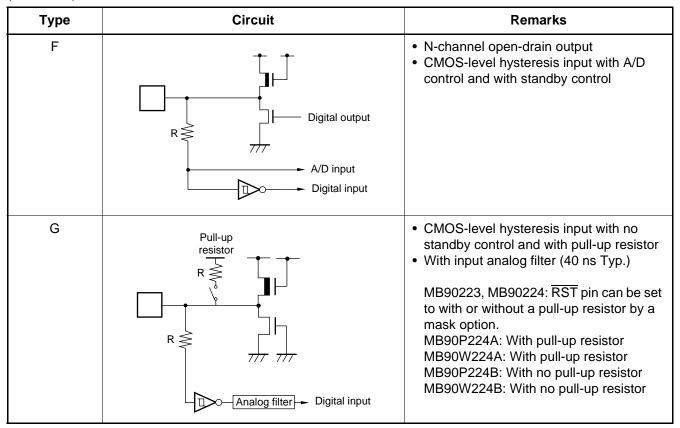

Note: The pull-up and pull-down resistors are always connected, regardless of the state.

Note: The pull-up and pull-down resistors are always connected, regardless of the state.

(Continued)

☐ ⊢ : P-type transistor ☐ ⊢ : N-type transistor

Note: The pull-up and pull-down resistors are always connected, regardless of the state.

■ HANDLING DEVICES

1. Preventing Latchup

CMOS ICs may cause latchup when a voltage higher than V_{CC} or lower than V_{SS} is applied to input or output pins other than medium-and high-voltage pins, or when a voltage exceeding the rating is applied between V_{CC} and V_{SS} .

If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Use meticulous care not to let any voltage exceed the maximum rating.

Also, take care to prevent the analog power supply (AVcc and AVRH) and analog input from exceeding the digital power supply (Vcc) when the analog system power supply is turned on and off.

2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

3. Treatment of Pins when A/D is not Used

Connect to be AVcc = AVRH = Vcc and AVss = AVRL = Vss even if the A/D converter is not in use.

4. Precautions when Using an External Input

To reset the internal circuit properly by the "L" level input to the \overline{RST} pin, the "L" level input to the \overline{RST} pin must be maintained for at least five machine cycles. Pay attention to it if the chip uses external clock input.

5. Vcc and Vss Pins

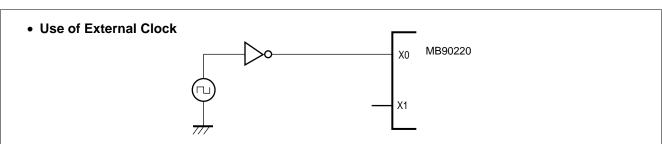

Apply equal potential to the Vcc and Vss pins.

6. Supply Voltage Variation

The operation assurance range for the V_{CC} supply voltage is as given in the ratings. However, sudden changes in the supply voltage can cause misoperation, even if the voltage remains within the rated range. Therefore, it is important to supply a stable voltage to the IC. The recommended power supply control guidelines are that the commercial frequency (50 to 60 Hz) ripple variation (P-P value) on V_{CC} should be less than 10% of the standard V_{CC} value and that the transient rate of change during sudden changes, such as during power supply switching, should be less than 0.1 V/ms.

7. Notes on Using an External Clock

When using an external clock, drive the X0 pin as illustrated below. When an external clock is used, oscillation stabilization time is required even for power-on reset and wake-up from stop mode.

Note: When using an external clock, be sure to input external clock more than 6 machine cycles after setting the $\overline{\text{HST}}$ pin to "L" to transfer to the hardware standby mode.

8. Power-on Sequence for A/D Converter Power Supplies and Analog Inputs

Be sure to turn on the digital power supply (Vcc) before applying voltage to the A/D converter power supplies (AVcc, AVRH, and AVRL) and analog inputs (AN00 to AN15).

When turning power supplies off, turn off the A/D converter power supplies (AVcc, AVRH, and AVRL) and analog inputs (AN00 to AN15) first, then the digital power supply (Vcc).

When turning AVRH on or off, be careful not to let it exceed AVcc.

■ PROGRAMMING FOR MB90P224A/P224B/W224A/W224B

In EPROM mode, the MB90P224A/P224B/W224A/W224B functions equivalent to the MBM27C1000. This allows the EPROM to be programmed with a general-purpose EPROM programmer by using the dedicated socket adapter (do not use the electronic signature mode).

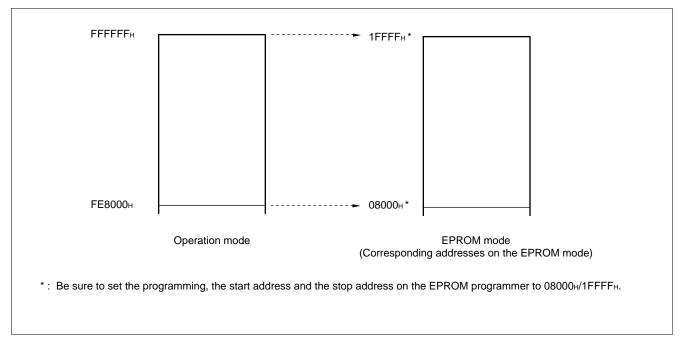

1. Program Mode

When shipped from Fujitsu, and after each erasure, all bits (96 K \times 8 bits) in the MB90P224A/P224B/W224A/W224B are in the "1" state. Data is written to the ROM by selectively programming "0's" into the desired bit locations. Bits cannot be set to "1" electrically.

2. Programming Procedure

- (1) Set the EPROM programmer to MBM27C1000.
- (2) Load program data into the EPROM programmer at 08000H to 1FFFFH.

Note that ROM addresses FE8000_H to FFFFFH in the operation mode in the MB90P224A/P224B/W224A/W224B series assign to 08000_H to 1FFFFH in the EPROM mode (on the EPROM programmer).

- (3) Mount the MB90P224A/P224B/W224A/W224B on the adapter socket, then fit the adapter socket onto the EPROM programmer. When mounting the device and the adapter socket, pay attention to their mounting orientations.
- (4) Start programming the program data to the device.
- (5) If programming has not successfully resulted, connect a capacitor of approx. 0.1 μF between Vcc and GND, between VPP and GND.

Note: The mask ROM products (MB90223, MB90224) does not support EPROM mode. Data cannot, therefore, be read by the EPROM programmer.

3. EPROM Programmer Socket Adapter and Recommended Programmer Manufacturer

Part No.			MB90P224B
Package	QFP-120		
Compatible sock Sun Hayato Co.,	ROM-120QF-32DP-16F

4. Erase Procedure

Data written in the MB90W224A/W224B is erased (from "0" to "1") by exposing the chip to ultraviolet rays with a wavelength of 2,537 Å through the translucent cover.

Recommended irradiation dosage for exposure is 10 Wsec/cm². This amount is reached in 15 to 20 minutes with a commercial ultraviolet lamp positioned 2 to 3 cm above the package (when the package surface illuminance is $1200 \, \mu \text{W/cm}^2$).

If the ultraviolet lamp has a filter, remove the filter before exposure. Attaching a mirrored plate to the lamp increases the illuminance by a factor of 1.4 to 1.8, thus shortening the required erasure time. If the translucent part of the package is stained with oil or adhesive, transmission of ultraviolet rays is degraded, resulting in a longer erasure time. In that case, clean the translucent part using alcohol (or other solvent not affecting the package).

The above recommended dosage is a value which takes the guard band into consideration and is a multiple of the time in which all bits can be evaluated to have been erased. Observe the recommended dosage for erasure; the purpose of the guard band is to ensure erasure in all temperature and supply voltage ranges. In addition, check the life span of the lamp and control the illuminance appropriately.

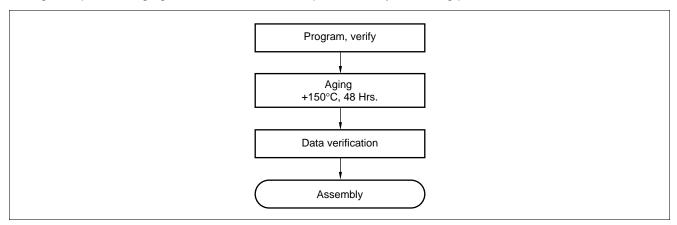

Data in the MB90W224A/W224B is erased by exposure to light with a wavelength of 4,000 Å or less.

Data in the device is also erased even by exposure to fluorescent lamp light or sunlight although the exposure results in a much lower erasure rate than exposure to 2,537 Å ultraviolet rays. Note that exposure to such lights for an extended period will therefore affect system reliability. If the chip is used where it is exposed to any light with a wavelength of 4,000 Å or less, cover the translucent part, for example, with a protective seal to prevent the chip from being exposed to the light.

Exposure to light with a wavelength of 4,000 to 5,000 Å or more will not erase data in the device. If the light applied to the chip has a very high illuminance, however, the device may cause malfunction in the circuit for reasons of general semiconductor characteristics. Although the circuit will recover normal operation when exposure is stopped, the device requires proper countermeasures for use in a place exposed continuously to such light even though the wavelength is 4,000 Å or more.

5. Recommended Screening Conditions

High temperature aging is recommended as the pre-assembly screening procedure.

6. Programming Yeild

MB90P224A/P224B cannot be write-tested for all bits due to their nature. Therefore the write yield cannot always be guaranteed to be 100%.

7. Pin Assignments in EPROM Mode

- ©: El²OS is supported (with stop request).
- \square : El²OS is supported (without stop request).
- O: El²OS is supported; however, since two interrupt sources are allocated to a single ICR, in case El²OS is used for one of the two, El²OS and ordinary interrupt are not both available for the other (with stop request).
- △: El²OS is supported; however, since two interrupt sources are allocated to a single ICR, in case El²OS is used for one of the two, El²OS and ordinary interrupt are not both available for the other (without stop request).
- \times : El²OS is not supported.

Note: Since the interrupt sources having interrupt vector Nos. 15 to 18, 20, and 25 to 28 are OR'ed, respectively, select them by means of the interrupt enable bits of each resource.

If El²OS is used with the above-mentioned interrupt sources OR'ed with the interrupt vector Nos. 15 to 18, 20, and 25 to 28, be sure to activate one of the interrupt sources.

Also in this case, a request flag in the same series as the one interrupt source is likely to be cleared automatically by El²OS.

Assume for example that an interrupt for compare 4 of the interrupt vector No. 25 is activated at this time by ICR07, so that the compare 6 is disabled. If El²OS is activated at this time by ICR07, so that the compare 6 interrupt takes place during generation of or simultaneously with the compare 4 interrupt, not only the interrupt flag for the compare 4 but also that for the compare 6 will be automatically cleared after El²OS is automatically transferred due to the compare 4 interrupt.

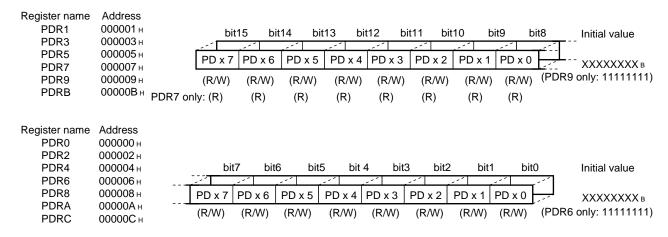

■ PERIPHERAL RESOURCES

1. Parallel Ports

The MB90220 series has 86 I/O pins and 16 open-drain I/O pins.

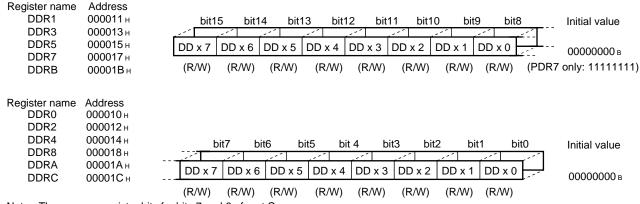

(1) Register Configuration

Port 0 to C Data Register (PDR0 to PDRC)

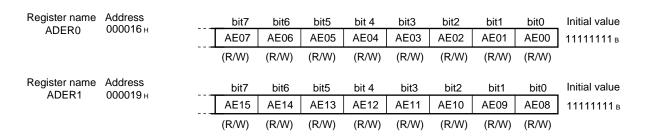

Note: There are no register bits for bits 7 and 6 of port C.

Port 0 to C Data Register (PDR0 to PDRC)

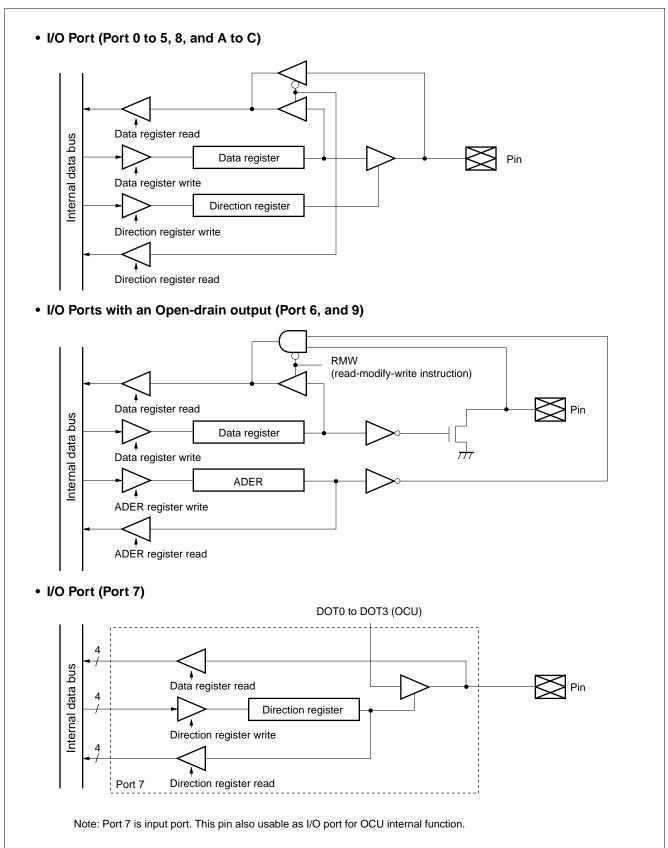

Note: There are no register bits for bits 7 and 6 of port C.

• Port 6, 9 Analog Input Enable Register (ADER0, ADER1)

(2) Block Diagram

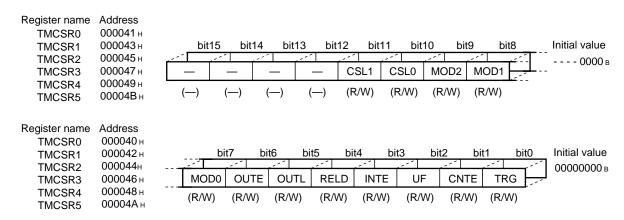

2. 16-bit Reload Timer (with Event Count Function)

The 16-bit reload timer 1 consists of a 16-bit down counter, a 16-bit reload register, an input pin (TIN), an output pin (TOT), and a control register. The input clock can be selected from among three internal clocks and one external clock. At the output pin (TOT), the pulses in the toggled output waveform are output in the reload mode; the rectangular pulses indicating that the timer is counting are in the single-shot mode. The input pin (TIN) can be used for event input in the event count mode, and for trigger input or gate input in the internal clock mode.

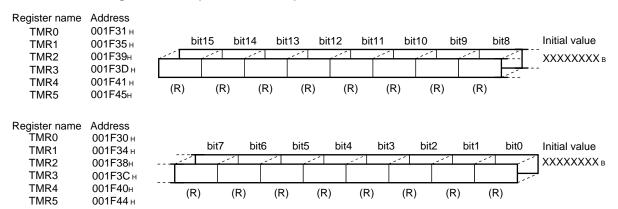

The MB90220 series has six channels for this timer.

(1) Register Configuration

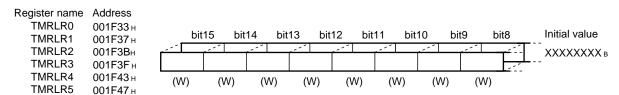

• Timer Control Status Register 0 to 5 (TMCSR0 to TMCSR5)

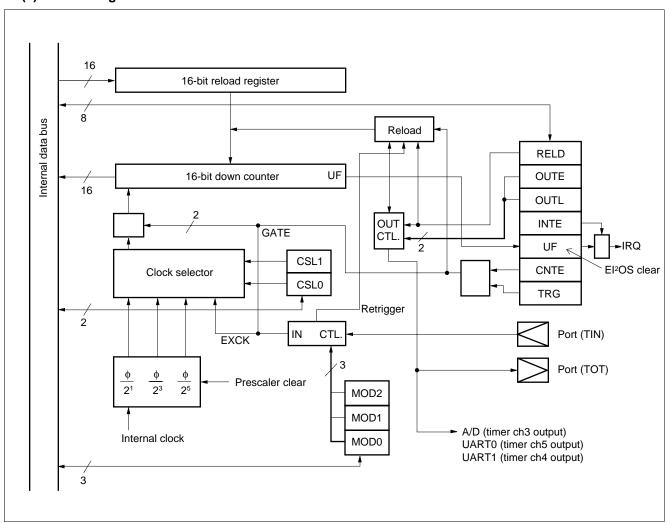

16-bit Timer Register 0 to 5 (TMR0 to TMR5)

16-bit Timer Reload Register 0 to 5 (TMRLR0 to TMRLR5)

3. UARTO

UART0 is a serial I/O port for synchronous or asynchronous communication with external resources. It has the following features:

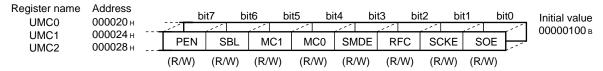

- Full duplex double buffer
- CLK synchronous and CLK asynchronous data transfers capable
- Multiprocessor mode support (Mode 2)
- Built-in dedicated baud-rate generator (12 rates)
- · Arbitrary baud-rate setting from external clock input or internal timer
- Variable data length (7 to 9 bits (without parity bit); 6 to 8 bits (with parity bit))
- Error detection function (Framing, overrun, parity)
- Interrupt function (Two sources for transmission and reception)
- Transfer in NRZ format

The MB90220 has three of these modules on chip.

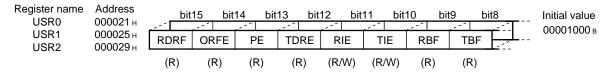

(1) Register Configuration

• Mode Control Register 0 to 2 (UMC0 to UMC2)

Serial mode control register

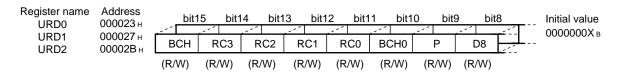

Status Register 0 to 2 (USR0 to USR2)

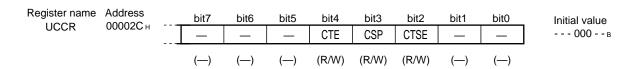

Input Data Register 0 to 2 (UIDR0 to UIDR2)/Ouput Data Register 0 to 2 (UODR0 to UODR2)

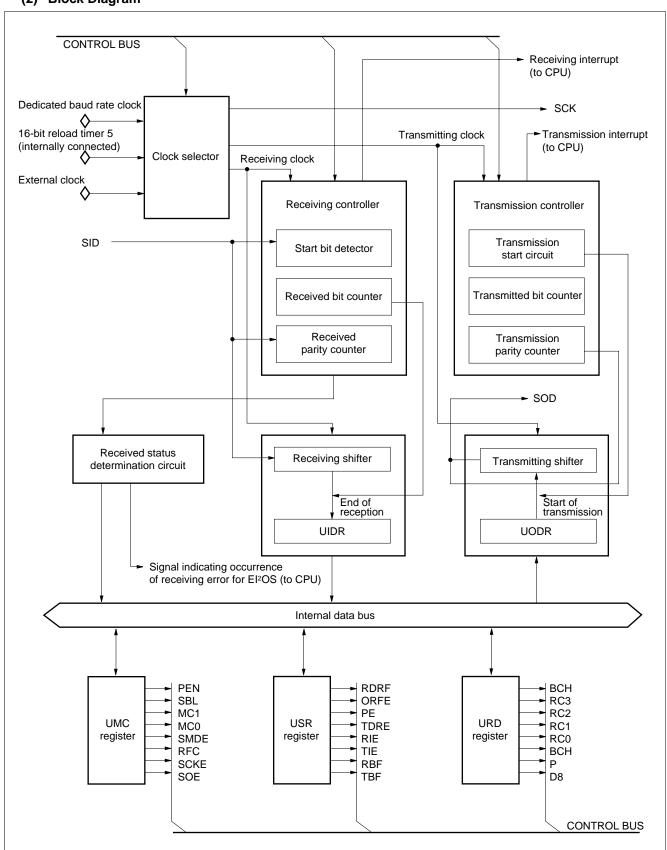

Rate and Data Register 0 to 2 (URD0 to URD2)

• UART CTS Control Register (UCCR)

4. UART1

The UART1 is a serial I/O port for asynchronous communications (start-stop synchronization) or CLK synchronized communications. It has the following features:

- Full-duplex double buffering
- Permits asynchronous (start-stop synchronization) and CLK synchronous communications
- Multiprocessor mode support
- Built-in dedicated baud rate generator

Asynchronous:

9615, 31250, 4808, 2404, and 1202 bps

CLK synchronization: 1 M, 500 K, 250 K bps

- · Arbitray baud-rate setting from external clock input or internal timer
- Error detection function (parity errors, framing errors, and overrun errors)
- Transfer in format NRZ
- Extended supports intelligent I/O service

5. 10-bit A/D Converter

The 10-bit A/D converter converts analog input voltage into a digital value. The features of this module are described below:

Conversion time: 6.125 μs/channel (min.) (with machine clock running at 16 MHz)

· Uses RC-type sequential comparison and conversion method with built-in sample and hold circuit

• 10-bit resolution

Analog input can be selected by software from among 16 channels
 Single-conversion mode:
 Selects and converts one channel.

Scan conversion mode: Converts several consecutive channels (up to 16 can be programmed).

One-shot mode: Converts the specified channel once and terminates.

Continuous conversion mode: Repeatedly converts the specified channel.

Stop conversion mode: Pauses after converting one channel and waits until the next startup (permits

synchronization of start of conversion).

When A/D conversion is completed, an "A/D conversion complete" interrupt request can be issued to the CPU.
 Because the generation of this interrupt can be used to start up the El²OS and transfer the A/D conversion results to memory, this function is suitable for continuous processing.

• Startup triggers can be selected from among software, an external trigger (falling edge), and a timer (rising edge).

(1) Register Configuration

A/D Channel Setting Register (ADCH)

This register specfies the A/D converter conversion channel.

Register name	Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	Initial value
ADCH	000032н	ANS3	ANS2	ANS1	ANS0	ANE3	ANE2	ANE1	ANE0	00000000 в
		(R/W)								

• A/D Mode Register (ADMD)

This register specfies the A/D converter operation mode and the startup source.

Register name	Address	bit15	bit14	bit13	bit12	bit11	bit10	bit9	bit8	Initial value

		(R)	(R)	(R)	(R)	(R)	(R)	(R)	(R)	

6. PWC (Pulse Width Count) Timer

The PWC (pulse width count) timer is a 16-bit multifunction up-count timer with an input-signal pulse-width count function and a reload timer function. The hardware configuration of this module is a 16-bit up-count timer, an input pulse divider with divide ratio control register, four count input pins, and a 16-bit control register. Using these components, the PWC timer provides the following features:

• Timer functions: An interrupt request can be generated at set time intervals.

Pulse signals synchronized with the timer cycle can be output.

The reference internal clock can be selected from among three internal clocks.

Pulse-width count functions: The time between arbitrary pulse input events can be counted.

The reference internal clock can be selected from among three internal clocks.

Various count modes:

"H" pulse width (\uparrow to \downarrow)/"L" pulse width (\downarrow to \uparrow) Rising-edge cycle (\uparrow to \uparrow /Falling-edge cycle (\downarrow to \downarrow)

Count between edges (\uparrow or \downarrow to \downarrow or \uparrow)

Cycle count can be performed by 2^{2n} division (n = 1, 2, 3, 4) of the input

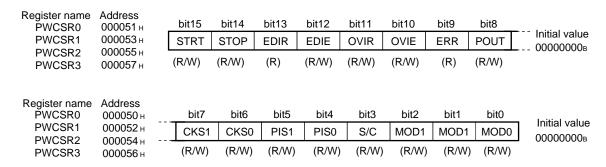

pulse, with an 8 bit input divider.

An interrupt request can be generated once counting has been performed. The number of times counting is to be performed (once or subsequently) can be selected.

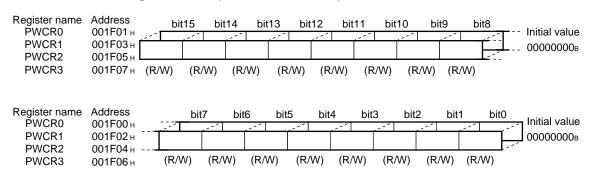

The MB90220 series has four channels for this module.

(1) Register Configuration

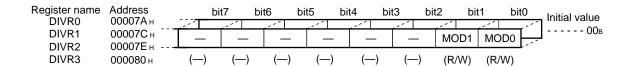

PWC Control Status Register 0 to 3 (PWCSR0 to PWCSR3)

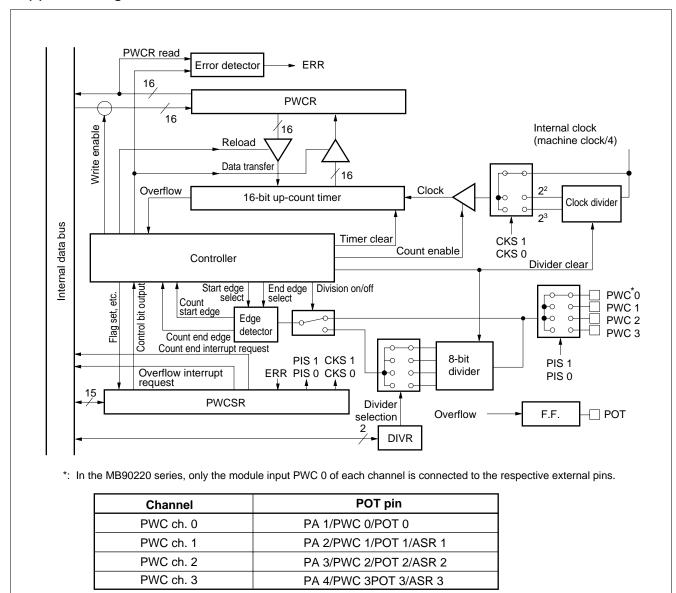

PWC Data Buffer Register 0 to 3 (PWCR0 to PWCR3)

• PWC Division Ratio Control Register 0 to 3 (DIVR0 to DIVR3)

7. DTP/External Interrupts

DTP (Data Transfer Peripheral) is located between external peripherals and the F²MC-16F CPU. It receives a DMA request or an interrupt request generated by the external peripherals and reports it to the F²MC-16F CPU to activate the extended intelligent I/O service or interrupt handler. The user can select two request levels of "H" and "L" for extended intelligent I/O service or, and four request levels of "H," "L," rising edge and falling edge for external interrupt requests. In MB90220, only parts corresponding to INT2 to INT0 are usable as external interrupt/DTP request.

Parts corresponding to INT7 to INT3 cannot be used as external interrupt/DTP request, but only for edge detection at external terminals.

Note: INT7 to INT3 are not usable as DTP/external interrupts.

(1) Register Configuration

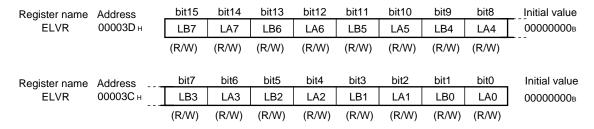

• DTP/Interrupt Enable Register (ENIR)

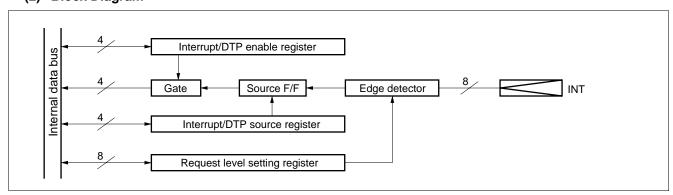

Register name	Address	 bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	Initial value
ENIR	00003А н	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0	00000000В
		 (R/W)	(R/W)							

DTP/Interrupt Source Register (EIRR)

EIRR	00003В н	ER7	ER6	ER5	ER4	ER3	ER2	ER1	ER0	00000000в
	•	(R/W)								

Request Level Setting Register (ELVR)

8. 24-bit Timer Counter

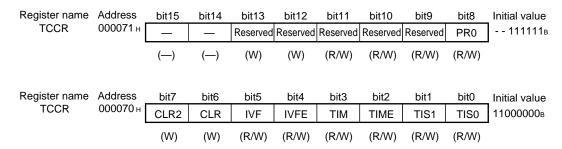

The 24-bit timer counter consists of a 24-bit up-counter, an 8-bit output buffer register, and a control register. The count value output by this timer counter is used to generate the base time used for input capture and output compare.

The interrupt functions provided are timer overflow interrupts and timer intermediate bit interrupts. The intermediate bit interrupt permits four time settings.

The 24-bit timer counter value is cleared to all zeroes by a reset.

(1) Register Configuration

Free-run Timer Control Register (TCCR)

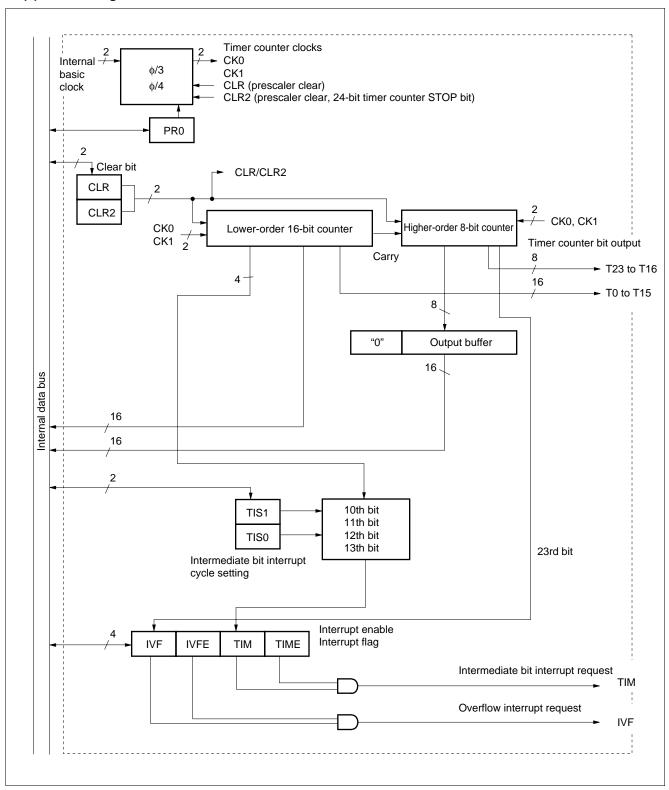

• Free-run Timer Low-order Data Register (TCRL)

• Free-run Timer High-order Data Register (TCRH)

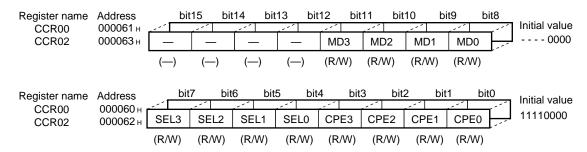

9. OCU (Output Compare Unit)

The OCU (Output Compare Unit) consists of a 24-bit output compare register, a comparator, and a control register.

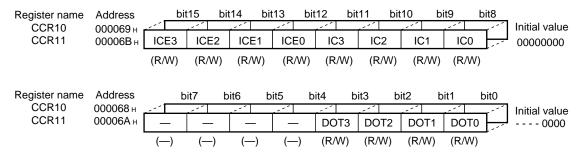

The match detection signal is output when the contents of the output compare register match the contents of the 24-bit timer counter. This match detection signal can be used to change the output value of the corresponding pin, or can be used to generate an interrupt. One block consists of four output compare units, and the four output compare registers use one comparator to perform time division comparisons.

(1) Register Configuration

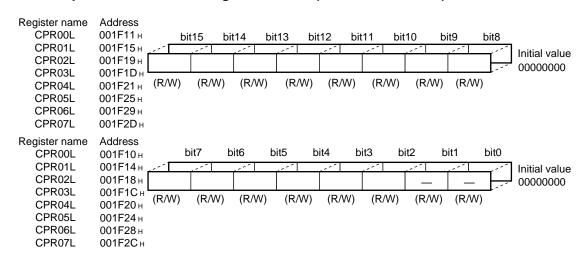

• OCUO Control Register 00, 01 (CCR00, CCR01)

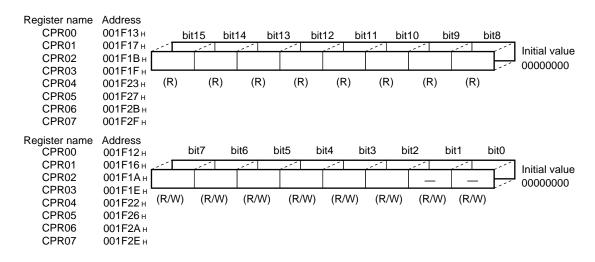

OCUO Control Register 10, 11 (CCR10, CCR11)

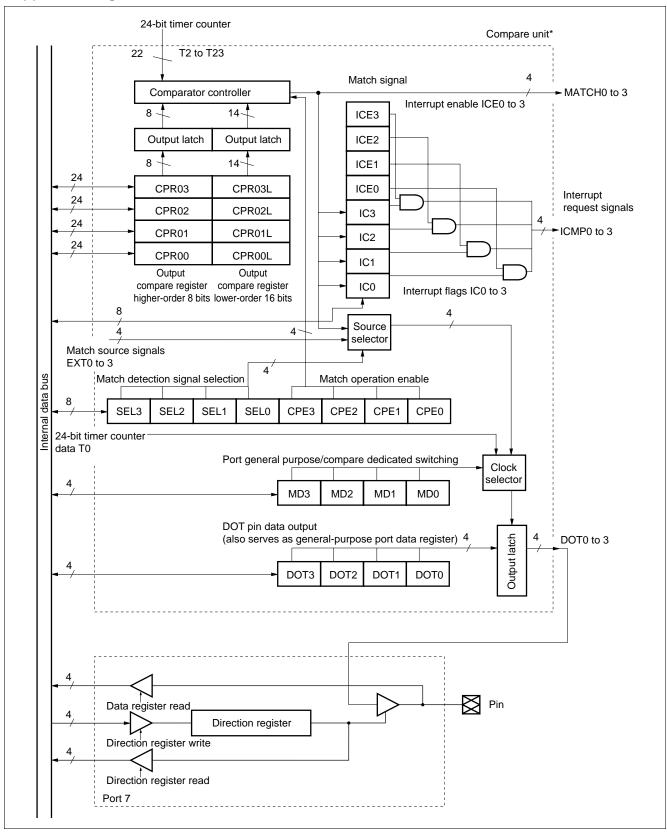

OCU Compare Low-order Data Register 00 to 07 (CPR00L to CPR07L)

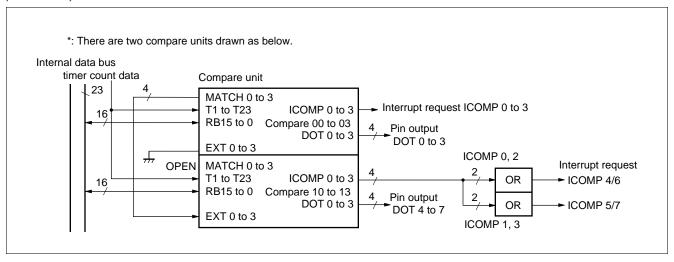

• Output Compare High-order Data Register 00 to 07 (CPR00H to CPR07H)

(Continued)

10. ICU (Input Capture Unit)

This module detects either the rising edge, falling edge, or both edges of an externally input waveform and holds the value of the 24-bit timer counter at that time, while at the same time the module generates an interrupt request for the CPU. The module consists of a 24-bit input capture data register and a control register. There are four external input pins (ASR0 to ASR3); the operation of each input is described below.

ASR0 to ASR3: Each of these input pins has a corresponding input capture register. When the specified valid edge (\uparrow or \downarrow or $\uparrow \downarrow$) is detected, the register can be used to store the 24-bit timer counter value.

(1) Register Configuration

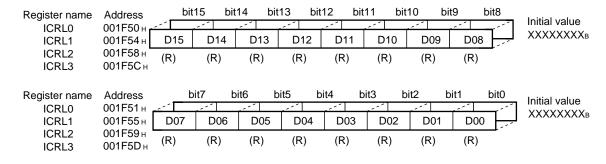

• ICU Control Register 0 (ICC0)

Register name	Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	. laitialala

		(R/W)								

ICU Low-order Data Register (ICRL0 to ICRL3)

ICU High-order Data Register (ICRH0 to ICRH3)

11. 16-bit PPG Timer

This module can output a pulse synchronized with an external trigger or a software trigger. In addition, the cycle and duty ratio of the output pulse can be changed as desired by overwriting the two 16-bit register values.

PWM function: Synchronizes pulse with trigger, and permits programming of the pulse output by

overwriting the register values mentioned above.

This function permits use as a D/A converter with the addition of external circuits.

One-shot function: Detects the edge of trigger input, and permits single-pulse output. There is no

trigger input for PPG1.

This module consists of a 16-bit down-counter, a prescaler, a 16-bit synchronization setting register, a 16-bit duty register, a 16-bit control register, one external trigger input pin, and one PPG output pin.

(1) Register Configuration

• PPG0, PPG1 Duty Setting Register (PDUT0, PDUT1)

12. Watchdog Timer and Timebase Timer Functions

The watchdog timer consists of a 2-bit watchdog counter using carry from an 18-bit timebase timer as the clock source, a control register, and a watchdog reset control section. The timebase timer consists of an 18-bit timer and an interval interrupt control circuit.

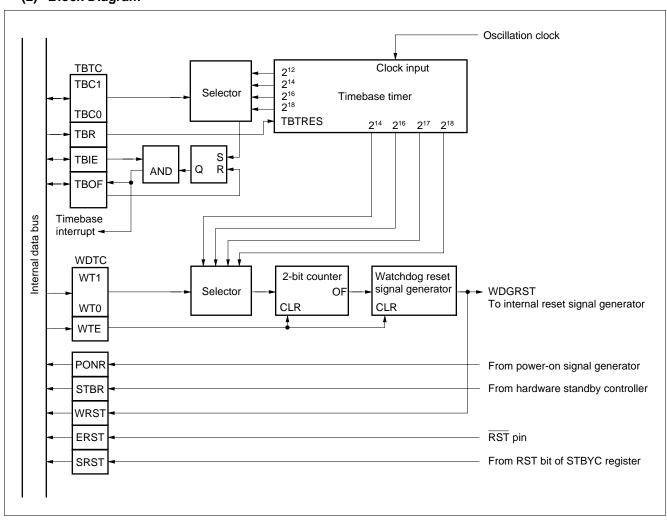

(1) Register Configuration

Watchdog Timer Control Register (WDTC)

Register name	Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	Initial value
WDTC	0000А8 н	PONR	STBR	WRST	ERST	SRST	WTE	WT1	WT0	XXXXXXXX
		(R)	(R)	(R)	(R)	(R)	(W)	(W)	(W)	, , , , , , , , , , , , , , , , , , , ,

• Timebase Timer Control Register (TBTC)

Register name		bit15	bit14	bit13	bit12	bit11	bit10	bit9	bit8	Initial value
TBTC	0000А9 н	_	_	_	TBIE	TBOF	TBR	TBC1	TBC0	
		(—)	(—)	(—)	(R/W)	(R/W)	(R)	(R/W)	(R/W)	

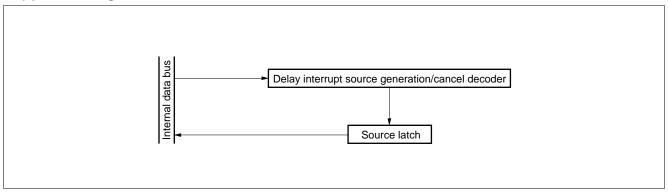

13. Delay Interruupt Generation Module

The delayed interrupt generation module is used to generate an interrupt task switching. Using this module allows an interrupt request to the F²MC-16F CPU to generated or cancel by software.

(1) Register Configuration

• Delay Interrupt Source Generation/Cancel Register (DIRR)

14. Write-inhibit RAM

The write-inhibit RAM is write-protectable with the \overline{WI} pin input. Maintaining the "L" level input to the \overline{WI} pin prevents a certain area of RAM from being written. The \overline{WI} pin has a 4-machine-cycle filter.

(1) Register Configuration

• WI Control Register (WICR)

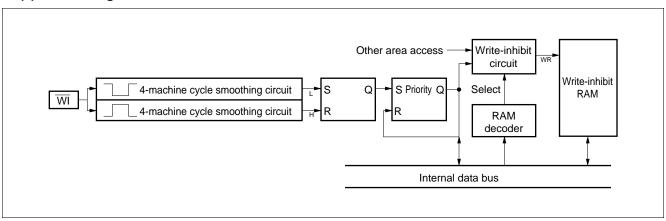

(2) Write-inhibit RAM Areas

Write-inhibit RAM areas: 000D00H to 000EFFH (MB90223)

001300н to 0014FFн (MB90224/P224A/P224B/W224A/W224B)

001500н to 0018FFн (MB90V220)

15. Low-power Consumption Modes, Oscillation Stabilization Delay Time, and Gear Function

The MB90220 series has three low-power consumption modes: the sleep mode, the stop mode, the hardware standby mode, and gear function.

Sleep mode is used to suspend only the CPU operation clock; the other components remain in operation. Stop mode and hardware standby mode stop oscillation, minimizing the power consumption while holding data.

The gear function divides the external clock frequency, which is used usually as it is, to provide a lower machine clock frequency. This function can therefore lower the overall operation speed without changing the oscillation frequency. The function can select the machine clock as a division of the frequency of crystal oscillation or external clock input by 1, 2, 4, or 16.

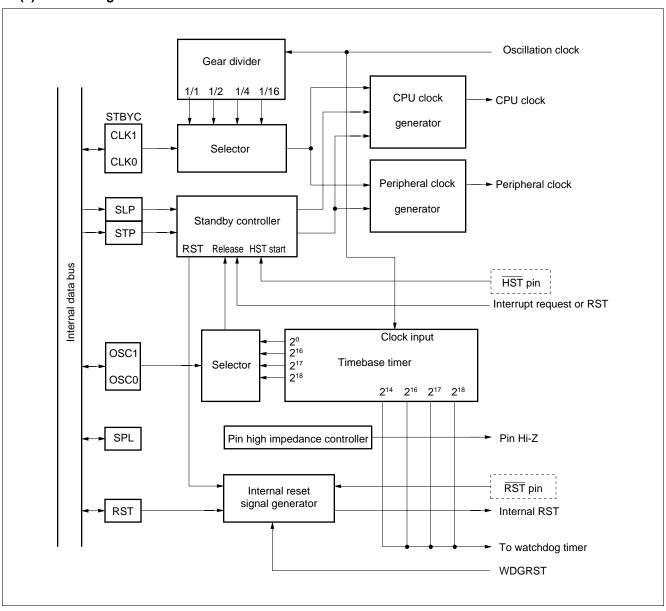

The OSC1 and OSC0 bits can be used to set the oscillation stabilization delay time for wake-up from stop mode or hardware standby mode.

(1) Register Configuration

Standby Control Register (STBYC)

Register name	Address	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0	Initial value
STBYC	0000А0 н	STP	SLP	SPL	RST	OSC1	OSC0	CLK1	CLK0	0001***
		(W)	(W)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	

Note: The initial value (*) of bit0 to bit3 is changed by reset source.

Operating temperature	T _A *		-40	+85	°C	Single-chip mode MB90P224A/W224A
			-40	+70	°C	External bus mode

^{* :} Excluding the temperature rise due to the heat produced.

WARNING:Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

3. DC Characteristics

Single-chip mode MB90223/224/P224B/W224B : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C to } +105^{\circ}\text{C}$) MB90P224A/W224A : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40^{\circ}\text{C to } +85^{\circ}\text{C}$)

External bus mode : $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, \text{ Vss} = 0.0 \text{ V}, \text{ T}_A = -40 ^{\circ}\text{C to } +70 ^{\circ}\text{C})$

(3) Reset and Hardware Standby Input Standards

Single-chip mode MB90223/224/P224B/W224B: (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, TA = -40°C to +105°C) MB90P224A/W224A : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, TA = -40°C to +85°C)

External bus mode (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, TA = -40 C to +63 C)

Value Pin Symbol **Parameter** Condition Unit Remarks name Min. Тур. Max. RST Reset input time **t**RSTL 5 tcyc ns Hardware standby input time **HST** t_{HSTL} 5 tcyc ns

*: The machine cycle time (tcyc) at hardware standby is set to 1/16 divided oscillation.

(4) Power on Supply Specifications (Power-on Reset)

Single-chip mode MB90223/224/P224B/W224B: (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, T_A = -40°C to +105°C)

MB90P224A/W224A : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40 ^{\circ}\text{C to } +85 ^{\circ}\text{C}$)

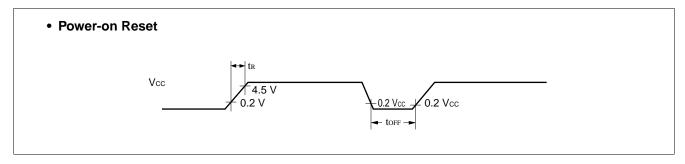

External bus mode : (Vcc = +4.5 V to +5.5 V, Vss = 0.0 V, $T_A = -40 ^{\circ}\text{C}$ to $+70 ^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
raiailletei				Min.	Тур.	Max.	Offic	iveillai ka
Power supply rising time	t R	Vcc	_	_	_	30	ms	*
Power supply cut-off time	t off	Vcc	_	1	_		ms	

^{* :} Before power supply rising, it is required to be Vcc < 0.2 V.

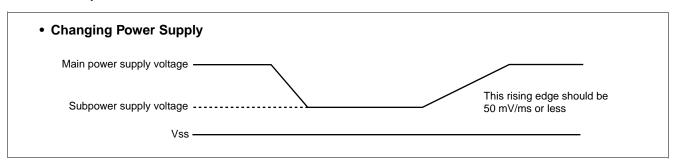

Notes: • Power-on reset assumes the above values.

- Whether the power-on reset is required or not, turn the power on according to these characteristics and trigger the power-on reset.
- There are internal registers (STBYC, etc.) which is initialized only by the power-on reset in the device.

Note: Note on changing power supply

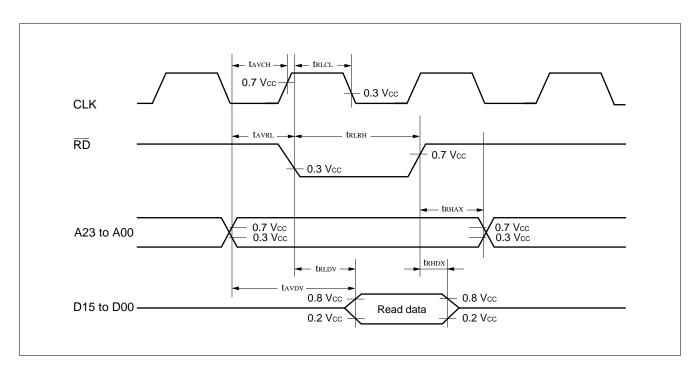

Even if above characteristics are not insufficient, abrupt changes in power supply voltage may cause a poweron reset. Therefore, at the time of a momentary changes such as when power is turned on, rise the power smoothly as shown below.

(5) Bus Read Timing

 $(Vcc = +4.5 \text{ V to } +5.5 \text{ V}, \text{ Vss} = 0.0 \text{ V}, \text{ TA} = -40^{\circ}\text{C to } +70^{\circ}\text{C})$

current	IRH	AVKI	_	_	_	5*2	μΑ	
Variation between channels	_	AN00 to AN15	_	_	_	4	LSB	

^{*1:} These standards in this table are for MB90224/P224A/P224B/W224A/W224B. MB90223: Minimum conversion time is 8.17 μ s and minimum sampling time is 5 μ s at toyc = 83.4 ns.

Notes: (1) The error becomes larger as | AVRH – AVRL | becomes smaller.

- (2) Use the output impedance of the external circuit for analog input under the following conditions: External circuit output impedance < approx. 10 k Ω (Sampling time approx. 3.75 μ s, teye = 62.5 ns)
- (3) Precision values are standard values applicable to sleep mode.
- (4) If Vcc/AVcc or Vss/AVss is caused by a noise to drop to below the analog input volgtage, the analog input current is likely to increase. In such cases, a bypass capacitor or the like should be provided in the external circuit to suppress the noise.

^{*2:} The current value applies to the CPU stop mode with the A/D converter inactive (Vcc = AVcc = AVRH = +5.5 V).

6. A/D Converter Glossary

Resolution: Analog changes that are identifiable with the A/D converter

When the number of bits is 10, analog voltage can be divided into $2^{10} = 1024$.

Total error: Difference between actual and logical values. This error is caused by a zero transition

error, full-scale transition error, linearity error, differential linearity error, or by noise.

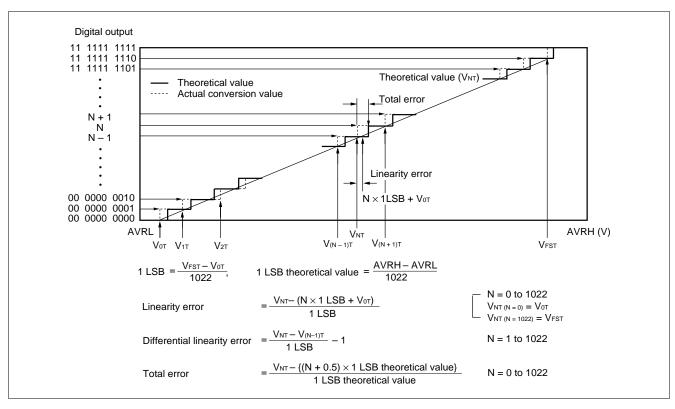

Linearity error: The deviation of the straight line connecting the zero transition point ("00 0000 0000"

 \leftrightarrow "00 0000 0001") with the full-scale transition point ("11 1111 1111" \leftrightarrow "11 1111

1110") from actual conversion characteristics

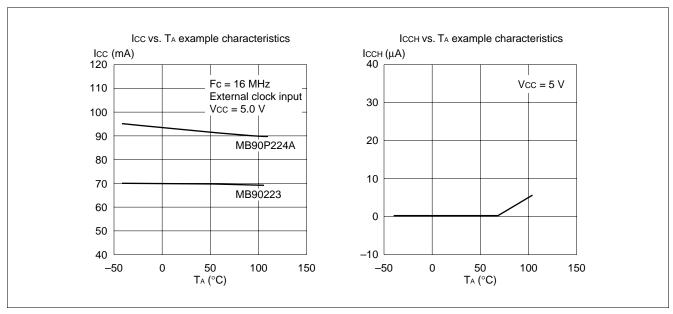

Differential linearity error: The deviation of input voltage needed to change the output code by 1 LSB from the

theoretical value

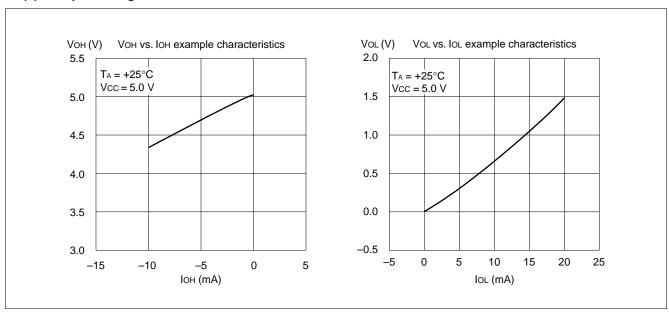

■ EXAMPLE CHARACTERISTICS

(1) Power Supply Current

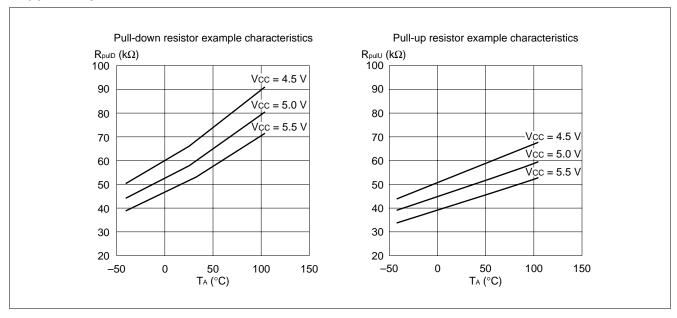

Note: These are not assured value of characteristics but example characteristics.

(2) Output Voltage

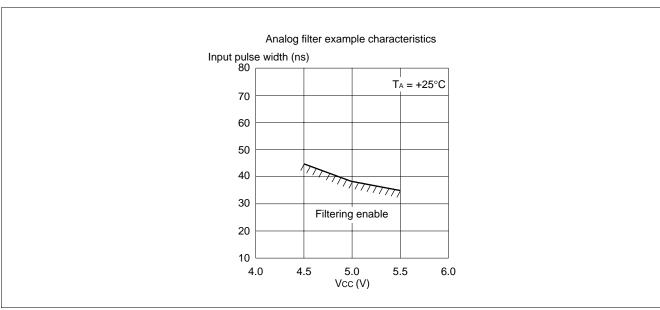

Note: These are not assured value of characteristics but example characteristics.

(3) Pull-up/Pull-down Resistor

Note: These are not assured value of characteristics but example characteristics.

(4) Analog Filter

Note: These are not assured value of characteristics but example characteristics.

■ INSTRUCTION SET (412 INSTRUCTIONS)

Table 1 Explanation of Items in Table of Instructions

Item	Explanation
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. See Table 4 for details about meanings of letters in items.
В	Indicates the correction value for calculating the number of actual cycles during execution of instruction. The number of actual cycles during execution of instruction is summed with the value in the "cycles" column.
Operation	Indicates operation of instruction.
LH	Indicates special operations involving the bits 15 through 08 of the accumulator. Z: Transfers "0". X: Extends before transferring. —: Transfers nothing.
АН	Indicates special operations involving the high-order 16 bits in the accumulator. *: Transfers from AL to AH. —: No transfer. Z: Transfers 00H to AH. X: Transfers 00H or FFH to AH by extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky
S	bit), N (negative), Z (zero), V (overflow), and C (carry). *: Changes due to execution of instruction.
Т	—: No change.
N	S: Set by execution of instruction. R: Reset by execution of instruction.
Z	
V	
С	
RMW	Indicates whether the instruction is a read-modify-write instruction (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.). *: Instruction is a read-modify-write instruction —: Instruction is not a read-modify-write instruction Note: Cannot be used for addresses that have different meanings depending on whether they are read or written.

Table 2 Explanation of Symbols in Table of Instructions

Symbol	Explanation
A	32-bit accumulator The number of bits used varies according to the instruction. Byte: Low order 8 bits of AL Word: 16 bits of AL Long: 32 bits of AL, AH
АН	High-order 16 bits of A
AL	Low-order 16 bits of A
SP	Stack pointer (USP or SSP)
PC	Program counter
SPCU	Stack pointer upper limit register
SPCL	Stack pointer lower limit register
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir addr16 addr24 addr24 0 to 15 addr24 16 to 23	Compact direct addressing Direct addressing Physical direct addressing Bits 0 to 15 of addr24 Bits 16 to 23 of addr24
io	I/O area (000000н to 0000FFн)

(Continued)

(Continued)

Symbol	Explanation
#imm4 #imm8 #imm16 #imm32 ext (imm8)	4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data signed and extended from 8-bit immediate data
disp8 disp16	8-bit displacement 16-bit displacement
bp	Bit offset value
vct4 vct8	Vector number (0 to 15) Vector number (0 to 255)
()b	Bit address
rel ear eam	Branch specification relative to PC Effective addressing (codes 00 to 07) Effective addressing (codes 08 to 1F)
rlst	Register list

Table 3 Effective Address Fields

Code	Notation	Address format	Number of bytes in address extemsion*
00 01 02 03 04 05 06 07	R0 RW0 RL0 R1 RW1 (RL0) R2 RW2 RL1 R3 RW3 (RL1) R4 RW4 RL2 R5 RW5 (RL2) R6 RW6 RL3 R7 RW7 (RL3)	Register direct "ea" corresponds to byte, word, and long-word types, starting from the left	
08 09 0A 0B	@RW0 @RW1 @RW2 @RW3	Register indirect	0
0C 0D 0E 0F	@ RW0 + @ RW1 + @ RW2 + @ RW3 +	Register indirect with post-increment	0

MOVMW eam, @A, #imm8	3+	*2	*4	Multiple data trasfer word (eam) \leftarrow ((A))	_	_	_	_	_	_	_	_	_	_
MOVMW@RLi, addr16, #imm8	5	*1	*4	Multiple data transfer word ((RLi)) ← (addr16)	_	_	_	_	_	_	_	_	_	_
MOVMW eam, addr16, #imm8	5+	*2	*4	Multiple data transfer word (eam) ← (addr16)	_	_	_	_	_	_	_	_	_	_
MOVM bnk: addr16, *5	7	*1	*3	Multiple data transfer	_	_	_	_	_	_	_	_	_	_
bnk : addr16, #imm8				byte (bnk:addr16) ← (bnk:addr16)										
MOVMW bnk: addr16, *5	7	*1	*4	Multiple data transfer	_	_	_	_	_	_	_	_	_	_
bnk: addr16, #imm8				word (bnk:addr16) ← (bnk:addr16)										

^{*1:} $5 + imm8 \times 5$, 256 times when imm8 is zero.

^{*2:} $5 + \text{imm8} \times 5 + (a)$, 256 times when imm8 is zero.

^{*3:} Number of transfers \times (b) \times 2

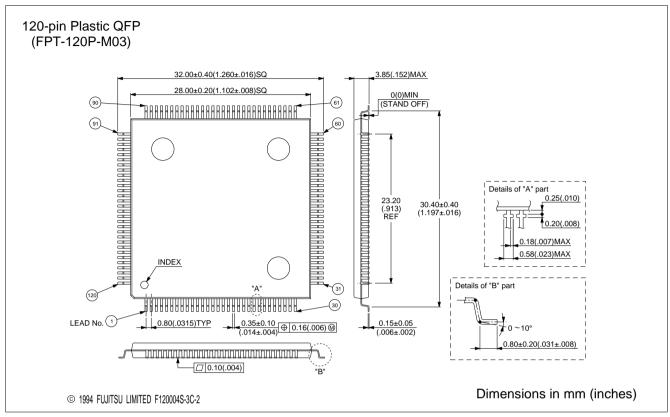

^{*4:} Number of transfers \times (c) \times 2

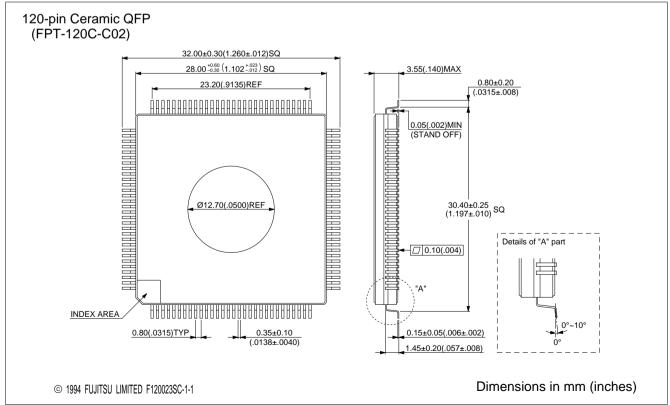

^{*5:} The bank register specified by "bnk" is the same as for the MOVS instruction.

■ ORDERING INFORMATION

Part number	Туре	Package	Remarks
MB90224 MB90223 MB90P224A MB90P224B	MB90224PF MB90223PF MB90P224PF MB90P224BPF	120-pin Plastic QFP (FPT-120P-M03)	
MB90W224A MB90W224B	MB90W224ZF MB90W224BZF	120-pin Ceramic QFP (FPT-120C-C02)	ES level only
MB90V220	MB90V220CR	256-pin Ceramic PGA (PGA-256C-A02)	For evaluation

■ PACKAGE DIMENSIONS

Note: See to the latest version of Package Data Book for official package dimensions.

FUJITSU LIMITED

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
