Introduction

IR is widely used in remoter control. With this IR receiver, the Arduino project is able to receive command from any IR remoter controller if you have the right decoder. Well, it will be also easy to make your own IR controller using IR transmitter.

Sample Code

```
// 0.1 by pmalmsten http://www.arduino.cc/cgi-bin/yabb2/YaBB.pl?num=117609843
4

// 0.2 by farkinga

// 0.3 by farkinga - adds cool behaviors

/* 0.4 by pstrobl

    changed the original program to use on IR Kit For Arduino Model: DFR0107 3
2 bit controller.

    All keypresses are sent to the serial monitor at 9600 baud.

    pulseIn is always HIGH. The phototransistor in the kit does not invert the
signal.

    uses pin 13 for heartbeat debug
```

32 bits requires a long variable, so divided up into two 15 bit so can use integer variables

use the first 15 bits of the 32 bits for remote and data stream verification. This code is always the same for every button press

use the last 15 of the 32 bits for button press selection. This code changes for each button.

ignore the middle 2 bits, it never changes.

*/

```
#define IR_BIT_LENGTH 32    // number of bits sent by IR remote
#define FirstLastBit 15    // divide 32 bits into two 15 bit chunks for integer variables. Ignore center two bits. they are all the same.
#define BIT_1 1500         // Binary 1 threshold (Microseconds)
#define BIT_0 450          // Binary 0 threshold (Microseconds)
#define BIT_START 4000     // Start bit threshold (Microseconds)

#define IR_PIN 2            // IR Sensor pin
#define LED_PIN 13          // LED goes off when signal is received

int debug = 0;              // flag as 1 to output raw IR pulse data stream length in microseconds
int output_verify = 0;      // flag as 1 to print decoded verification integers. same number for all buttons
int output_key = 0;         // flag as 1 to print decoded key integers
int remote_verify = 16128; // verifies first bits are 111111000000000 different remotes may have different start codes

void setup() {
    pinMode(LED_PIN, OUTPUT); //This shows when ready to receive
    pinMode(IR_PIN, INPUT);
    digitalWrite(LED_PIN, LOW);
    Serial.begin(9600);
}

void loop() {
    digitalWrite(LED_PIN, HIGH);
```

```

    int key = get_ir_key();

    digitalWrite(LED_PIN, LOW); // turn LED off while processing response
    do_response(key);
    delay(130);                  // 2 cycle delay to cancel duplicate keypresse
s
}

/*
    wait for a keypress from the IR remote, and return the
    integer mapping of that key (e.g. power button on remote returns
    the integer 1429)
*/

int get_ir_key()
