## DESCRIPTION

The CHL8112A/B are dual-loop digital multi-phase buck controllers that drive up to 5 phases. The CHL8112A/B is fully AMD® SVI compliant on both loops and provides a V<sub>tt</sub> tracking function for DDR memory.

NVM storage saves pins and enables a small package size.

The CHL8112A/B includes the CHiL Efficiency Shaping Technology to deliver exceptional efficiency at minimum cost across the entire load range. CHiL Variable Gate Drive optimizes the MOSFET gate drive voltage as a function of real-time load current. CHiL Dynamic Phase Control adds/drops active phases based upon load current. The CHL8112A/B can be configured to enter 1-phase operation and active diode emulation mode automatically or by command.

CHiL's unique Adaptive Transient Algorithm (ATA), based on proprietary non-linear digital PWM algorithms, minimizes output bulk capacitors. In addition, a coupled inductor mode, with phases added/dropped in pairs, enables further improvement in transient response and form factor.

The I2C/PMBus interface can communicate with up to 16 CHL8112A/B based VR loops. Device configuration and fault parameters are easily defined using the CHiL Intuitive Power Designer (IPD) GUI and stored in on-chip NVM.

The CHL8112A/B provides extensive OVP, UVP, OCP and OTP fault protection and includes thermistor based temperature sensing with VRHOT signal.

The CHL8112A/B also includes numerous features like register diagnostics for fast design cycles and platform differentiation, truly simplifying VRD design and enabling fastest time-to-market with its "set-and-forget" methodology.
