All Rights Reserved.

Attention please!

As far as patents or other rights of third parties are concerned, liability is only assumed for components, not for applications, processes and circuits implemented within components or assemblies.

The information describes the type of component and shall not be considered as assured characteristics.

Terms of delivery and rights to change design reserved.

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies AG is an approved CECC manufacturer.

Packing

Please use the recycling operators known to you. We can also help you – get in touch with your nearest sales office. By agreement we will take packing material back, if it is sorted. You must bear the costs of transport.

For packing material that is returned to us unsorted or which we are not obliged to accept, we shall have to invoice you for any costs incurred.

Components used in life-support devices or systems must be expressly authorized for such purpose!

Critical components¹ of the Infineon Technologies AG, may only be used in life-support devices or systems² with the express written approval of the Infineon Technologies AG.

- 1 A critical component is a component used in a life-support device or system whose failure can reasonably be expected to cause the failure of that life-support device or system, or to affect its safety or effectiveness of that device or system.
- 2 Life support devices or systems are intended (a) to be implanted in the human body, or (b) to support and/or maintain and sustain human life. If they fail, it is reasonable to assume that the health of the user may be endangered.

Overview

1 Overview

The IHPC is an integrated power controller especially designed for feeding two-wire ISDN-transmission lines. One line can be powered by one IHPC. An external resistor defines the value of the current-limit for the line. Powering can be switched on or off by the logic inputs "PFEN" and "PFENQ". With a logic low at the "APFI" output the IHPC signals that current-limiting is active; this signal is low-pass filtered. An external capacitor defines the corner frequency of this low-pass filter and the resulting delay time respectively. A second external capacitor is needed to make sure that longitudinal disturbances (AC) will not produce a current limiting effect. Line current-limiting and reducing this limiting level in case of overtemperature guards the IHPC against overloads.

ISDN High Voltage Power Controller IHPC

PEB 2026

CMOS

Version 1.1

1.1 Features

- Battery voltage up to 130 V
- Supplies power for one transmission line
- Current limiting and chip temperature control
- Limiting current can be programmed by an external resistor
- Automatically reduced feeding current in case of overtemperature
- Reliable 170 V Smart Power Technology (SPT 170)
- Small P-DSO-20 package

2.2 Pin Definitions and Functions

Table 2-1 Pin Definitions and Functions P-DSO-20-6

Pin	Symbol	Туре	Description			
4-7, 14-17	$V_{\scriptscriptstyle BAT}$	Supply	Negative battery supply voltage (– 100 V), referred to GNDB			
20	GNDB	Supply	Battery ground: RB and RA refer to this pin			
1	$V_{ m dd}$	Supply	Positive supply voltage (+ 5 V), referred to GNDD			
3	GNDD	Supply	Digital ground: V_{DD} , REF, CP, CN, CTP, PFEN, PFENQ and APFI refer to this pin			
9	REF	0	Reference output, connected to GNDD via a resistor			
19	СР	0	Positive pole of the external capacitor $C_{\rm HP}$			
18	CN	I	Negative pole of the external capacitor $C_{\rm HP}$			
2	CTP	0	Positive pole of the external capacitor C_{TP}			
11	RB	0	Output for powering line b (tip), current sensing			
12	RA	0	High voltage output for powering line a (ring), current limiting/switching			
10	PFEN	I	Logic high on this pin switches on the current feeding			
8	PFENQ	I	Logic low on this pin switches on the current feeding			
13	APFI	0	Logic low on this pin signals active current-limiting			

Table 2-2 Pin Definitions and Functions P-DSO-20-10

Pin	Symbol	Туре	Description
1,10, 11,20	$V_{\rm bat}$	Supply	Negative battery supply voltage (- 100 V), referred to GNDB
4	GNDB	Supply	Battery ground: RB and RA refer to this pin
5	$V_{ m dd}$	Supply	Positive supply voltage (+ 5 V), referred to GNDD
7	GNDD	Supply	Digital ground: $V_{\rm DD}$, REF, CP, CN, CTP, PFEN, PFENQ and APFI refer to this pin
15	REF	0	Reference output, connected to GNDD via a resistor
3	СР	0	Positive pole of the external capacitor C_{HP}
2	CN	I	Negative pole of the external capacitor $C_{\rm HP}$
6	CTP	0	Positive pole of the external capacitor C_{TP}
17	RB	0	Output for powering line b (tip), current sensing

Pin Description

Pin	Symbol	Туре	Description
18	RA	0	High voltage output for powering line a (ring), current limiting/switching
16	PFEN	I	Logic high on this pin switches on the current feeding
14	PFENQ	I	Logic low on this pin switches on the current feeding
19	APFI	0	Logic low on this pin signals active current-limiting

Table 2-2 Pin Definitions and Functions P-DSO-20-10 (cont'd)

Functional Description

Figure 3-1 Block Diagram

The current flowing from GNDB to RB is measured. A down scaled image of this current is filtered by a high-pass filter with a corner frequency f_{CHP} of approximately 3 Hz (see

Functional Description

Figure 5-4). This filter needs the external capacitor C_{HP} . This "AC"-current is subtracted from the reference-current generated in the bandgap. The value of the reference-current is defined by the external resistor R_{REF} .

In case of overtemperature the thermal protection TH-PROT sinks a current, so that the current I_{Limit} is reduced. So in case of high power dissipation on chip the junction temperature is limited to about 165 °C.

This function is a protection against instant damages due to overload at the outputs. Continuous high temperatures during operation, however, will reduce the life time of the IHPC. A maximum junction temperature of 150°C shall not be exceeded (See section 7, "Electrical Characteristics")

Measures have to be taken to switch off the IHPC in case of a short-circuit. E.g. if pin APFI indicates active current-limiting, the IHPC should be deactivated after 1.5 sec using pin PFEN or PFENQ. A consecutive power-up attempt shall give enough time to the IHPC to cool down again (e.g. 30 sec).

The current I_{Limit} is reflected to the output current I_{Line} flowing from RA to V_{BAT} using the operational-amplifier OP, the transistor T_{L} and two resistors (4 Ω , 4 k Ω).

$$I_{\text{Line,max}}$$
 (t) = 1000 × I_{Limit} (t) = 1000 × ($I_{\text{REF}} - I_{\text{TH-PROT}}$ (t) - I_{AC} (t))

In case of "no current-limiting" the output voltage of the operational-amplifier OP is equal to the positive OP-supply voltage. The transistor T_{L} is "switched on".

If the output current I_{Line} rises to $I_{\text{Line,max}}$ the current-mirror becomes active and keeps the output current at this level.

The voltage level at the gate of transistor $T_{\rm L}$ shows the state of the current-limiter (current-limiting active or not). This state-signal is filtered by a low-pass filter and generates the logic output APFI. The external capacitor $C_{\rm TP}$ of this low-pass filter defines the corner frequency and the resulting delay times $t_{\rm LIMON}$ (Spec.-No.: 17) and $t_{\rm LIMOFF}$ (Spec.-No.: 18) respectively.

Summarized, the current sensor I-SENS and the high-pass filter prevent, that a longitudinal disturbance in the frequency range from about $(5*f_{CHP})$ to about 100kHz result in a current limitation. This applies if the maximum amplitude of the longitudinal current is lower than about half of the current limit (Spec.-No.: 3) defined by the external resistor R_{REF} , see also Spec.-No.: 15 and 16.

There is also another effect from the current sensing and high-pass filtering, which can be seen when changing from status LIMOFF to LIMON. This can occur by switching power on to the line (loading the line capacitor) or in case of short-circuiting the line. The resulting current transient starts at half of $I_{\text{Line,max}}$ and increases (capacitor loading function) to $I_{\text{Line,max}}$ with a time constant t_{CHP} also defined by the value of C_{HP} .

Functional Description

The diodes connected to GNDB and RB protect the IHPC against lightning and overvoltages (**see Absolute Maximum Ratings**). The diode D_p is the parasitic bulk-drain-diode of the DMOS-transistor T_L .

Because of technology reasons ("p"-substrate, junction isolation) there are also parasitic diodes from pin $V_{\rm BAT}$ to all other pins.

I_{BAT} current peak:

When line feeding is switched on (transistor $T_{\rm L}$ is on) and a short circuit occurs between pins RA and GNDB (or GNDD) then it needs a certain time to unload the gate-sourcecapacitance of $T_{\rm L}$ and to limit the current to the defined maximum value. In the meantime a current peak $I_{\rm BAT}$ on the supply voltage $V_{\rm BAT}$ can be seen.

An overvoltage protection circuit for pin RA, for example can produce such a short circuit between pins RA and GNDB.

In the IHPC a fast bipolar npn-transistor limits such current peaks. With $V_{BAT} = 100 \text{ V}$, the resulting I_{BAT} current transient has the profile of one triangular pulse with a peak value of about 1.5A and a time duration (50% to 50%) of about 130nsec.

.

Operating Modes

4 Operating Modes

Operating Mode	Status	PFEN	PFENQ	APFI
OFF, powering off		"V _{IL} "	Don't care	" V_{OL} "
OFF, powering off		Don't care	"V _{IH} "	" V_{ol} "
ON, powering on	LIMON, limiter is active	" V_{IH} "	"V _{IL} "	" $V_{\rm ol}$ "
ON, powering on	LIMOFF, limiter isn't active	" V_{IH} "	"V _{IL} "	" $V_{ m OH}$ "

The logic input pins PFEN and PFENQ are connected to GNDD by integrated current sources. If these pins are not connected externally the logic level is " V_{μ} ".

5 Designing the External Components

Resistor R_{REF} :

The value of this resistor defines the current limit $I_{\text{Limit,ON}}$ (Spec.-No.: 3) and it will also effect power supply currents I_{BAT} (Spec.-No.: 2) and I_{DD} (Spec.-No.: 1). For typical values of $I_{\text{Limit,ON}}$, I_{BAT} and I_{DD} as a function of R_{REF} see the following diagrams.

Figure 5-1 Current limit $I_{\text{Limit,ON}}$ as a function of R_{REF} (typical values)

Figure 5-2 Power Supply Current I_{BAT} as a function of R_{REF} (typical values)

Figure 5-3 Power Supply Current I_{DD} as a function of R_{REF} (typical values)

Capacitor C_{HP} :

The value of this capacitor defines the corner frequency f_{CHP} of the high-pass filter and the time constant t_{CHP} of the current transient described at the last but one paragraph of chapter 2. The following diagrams show typical values of f_{CHP} and t_{CHP} as a function of C_{HP} .

Figure 5-4 Corner frequency of high-pass filter as a function of C_{HP} (typical values)

Figure 5-5 Time constant of high-pass filter as a function of C_{HP} (typical values)

Capacitor C_{TP} :

The value of this capacitor defines the corner frequency and the resulting delay times t_{LIMON} (Spec.-No.: 17) and t_{LIMOFF} (Spec.-No.: 18), of the low-pass filter. For typical values of t_{LIMOFF} as a function of C_{TP} see the following diagrams.

Figure 5-6 Delay time of the low-pass filter for the status output signal (typical values)

Figure 5-7 Delay time of the low-pass filter for the status output signal (typical values)

Application Note

6 Application Note

Figure 6-1 Application Circuit

Application Note

R _{ref}	Defines the current-limit and the internal biasing currents. A smaller/bigger value increases/decreases the current limit. It will also effect power supply currents.				
$C_{ ext{tp}}$	Defines with an internal resistor the delay time (a typical value is 20 msec) from the low pass filter, whose output signal is called 'APFI'. Short disturbances will therefore be filtered. A smaller/bigger value decreases/increases the delay time.				
$C_{\rm HP}$	Defines with an internal resistor the corner frequency from a high pass filter. It is used to make sure that longitudinal disturbances (AC) will not produce a current limiting effect. A smaller/bigger value decreases/increases the corner frequency.				
$R_{\rm la},R_{\rm lb}$	These resistors limit the peak currents during lightning transients. The maximum value for these resistors is defined by the allowed voltage drop on the resistors.				
С	The AC-signal-current will be shunted by this capacitor.				
А, В	A- and B-line to the subscriber				
$V_{\scriptscriptstyle BAT}$	The most negative supply voltage; also called battery voltage.				
overvoltage protection	This circuit makes sure that the voltage from R_{A} to V_{BAT} will not exceed the defined limits in case of lightning (see Absolute Maximum Ratings).				

Recommended Device Values:

R _{ref}	22 k Ω ,Current limiting is set to 50 mA
$C_{ ext{tp}}$	220 nF, APFI' delay time is set to 20 msec
$C_{\rm HP}$	4.7 $\mu\text{F},\text{AC}$ longitudinal disturbances in a frequency range higher than 16.666 Hz do not effect a current limiting.
$R_{\text{LA}}, R_{\text{LB}}$	23 Ω ,Minimum value, so that peek currents don't exceed 16 A (using voltage peek = 1 kV from 40 Ω source resistance) in case of lightning.

7 Electrical Characteristics

Table 7-1Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	max.		
Battery voltage	$V_{\scriptscriptstyle BAT}$	- 150	0.5	V	Referred to GNDB
$V_{\rm DD}$ supply voltage	$V_{ m dd}$	- 0.5	6	V	Referred to GNDD
Ground voltage difference	$V_{ m gndb} - V_{ m gndd}$	- 0.5	0.5	V	
Ground pulse voltage difference	$V_{ m gndb} - V_{ m gndd}$	- 1	1	V	$t_{\rm max}$ = 1 msec
Junction temperature	Tj		150	°C	
Voltages on logic inputs PFEN, PFENQ	$V_{ m pfen}, \ V_{ m pfenq}$	- 0.3	V _{DD} + 0.3	V	Referred to GNDD
Voltages on REF	$V_{\scriptscriptstyle {\sf REF}}$	- 0.3	V _{DD} + 0.3	V	Referred to GNDD
Voltages on CP	$V_{\rm CP}$	- 0.3	V _{DD} + 0.3	V	Referred to GNDD
Voltages on CN	$V_{\scriptscriptstyle {\sf CN}}$	- 0.3	$V_{\rm DD}$ + 0.3	V	Referred to GNDD
Voltages on CTP	$V_{\rm CTP}$	- 0.3	$V_{\rm DD}$ + 0.3	V	Referred to GNDD
Voltages on logic output APFI	$V_{\scriptscriptstyle APFI}$	- 0.3	V _{DD} + 0.3	V	Referred to GNDD
RB voltage	$V_{\scriptscriptstyle {\sf RB}}$	- 0.5	+ 0.5	V	Referred to GNDB
RB pulse current	I _{кв} (into pin RB)	- 8	8	A	$t_{\rm max}$ = 1 msec
RB peak current	$I_{{\scriptscriptstyle RB}_{{\scriptscriptstyle Peak}}}$	- 16	16	А	See figure 7-7
RA voltages	$V_{\scriptscriptstyle RA}$	- 0.3	150	V	Referred to $V_{\rm BAT}$
RA pulse current	$I_{\scriptscriptstyle RA}$ (into pin RA)	- 1	1	A	$t_{\rm max}$ = 1 msec
RA pulse voltage	$V_{{\sf RA_pulse}}$	- 1	170	V	$t_{\rm max}$ = 1 msec, Referred to $V_{\rm BAT}$
ESD-voltage, all pins			1	kV	Human body model

Note: Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

Parameter	Symbol	Limit Valu	ies	Unit	Test Condition
		min.	max.		
Battery voltage	$V_{\scriptscriptstyle BAT}$	- 130	- 30	V	Referred to GNDB
$V_{\text{\tiny DD}}$ supply voltage	V _{dd}	4.75	5.25	V	Referred to GNDD
Ground voltage difference	$V_{ m gndb} - V_{ m gndd}$	- 0.3	0.3	V	
Ambient temperature PEB 2026 PEF 2026		0 -40	+70 +85	°C °C	

Table 7-2Operating Range

Static Thermal Resistance

Junction to ambient	$R_{ m th, jA}$	55	K/W	P-DSO-20-10
Junction to case	$R_{ m th, jC}$	4	K/W	P-DSO-20-10
Junction to ambient	$R_{ m th, jA}$	65	K/W	P-DSO-20-6
Junction to pins	$R_{ m th, jPins}$	15	K/W	P-DSO-20-6

Note: In the operating range the functions given in the circuit description are fulfilled.

The power package P-DSO-20-10 has an exposed copper-heatspreader with a high thermal capacitance. For power feeding to ISDN-lines which are in a fault condition (e.g. short circuit) the maximum power dissipation on chip will become V_{BAT} supply voltage times limiting current (e.g.: 100V $_{\star}$ 50mA = 5W). It is necessary to try to feed the line for about 2 seconds under this condition (5W), then the feeding can be switched off but must be switched on again about 30 seconds later. In this application the thermal capacitance of the cooper-heatspreader helps to keep the maximum chip temperature below the thermal protection temperature level (165°C). No extra heatsink is necessary.

The small P-DSO-20-6 package is applicable if the device is mounted on a pcb having at least 900 mm² copper area close to the device. The pcb serves as heat sink, heat flowing off through the pins, particularly the Vbat pins. With a mounting like this, the IHPC performs as follows: a current of 50 mA is supplied for 5 sec, while the device is shorted to Vbat=100V. At an ambient temperature of 70°C the current pulse may be periodically repeated with a period of 32 sec.

Electrical Parameters

Typical values are defined at the following test conditions:

 V_{DD} =5V± 1 % C_{HP} =4.7 μ F± 10 %(6.3 V)

V_{BAT}=− 100V± 1 %C_{TP}=220nF± 10 %(6.3 V)

 $R_{\rm LA}$ =23 Ω ± 1 % $T_{\rm A}$ =25± 5 °C

 $R_{\text{LB}}=23\Omega \pm 1 \ \% R_{\text{Line}}=\pm \ 0.1 \ \%$

 R_{REF} =22k Ω ± 1 %no heatsink

Min. and max. values are in force within the whole operating range.
