

GENERAL DESCRIPTION

The 813321-04 is a two stage device – a VCXO followed by a FemtoClock™ PLL. The FemtoClock PLL can multiply the crystal frequency of the VCXO up to a range of 122MHz to 160MHz, with a random rms phase jitter of less than 1ps (1.875MHz – 20MHz). This phase jitter performance meets the requirements of 1Gb/10Gb Ethernet, 1Gb, 2Gb, 4Gb and 10Gb Fibre Channel, and SONET up to OC48.

FEATURES

- One 3.3V or 2.5V LVPECL output pair
- Crystal operating frequency range: 14MHz - 20MHz
- VCO range: 490MHz - 640MHz
- Output frequency range: 122MHz - 160MHz
- VCXO pull range: $\pm 50\text{ppm}$ (typical APR) @ 3.3V
- Supports the following applications (among others): SONET, Ethernet, Fibre Channel
- RMS phase jitter @ 156.25MHz (1.875MHz - 20MHz): 0.53ps (typical) @ 3.3V
- Supply voltage modes:
 V_{CC}/V_{CCO}
3.3V/3.3V
3.3V/2.5V
2.5V/2.5V
- 0°C to 70°C ambient operating temperature
- Available in both lead-free (RoHS 6) package
- **For functional replacement part use 8N3QV01EG-0016CDI**

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 6, 11, 15	nc	Unused		No connect.
2	V_{CCO}	Power		Output supply pin.
3, 4	Q, nQ	Output		Differential clock outputs. LVPECL interface levels.
5	V_{EE}	Power		Negative supply pin.
7	V_{CCA}	Power		Analog supply pin.
8	V_{CC}	Power		Core supply pin.
9, 10	XTAL_OUT, XTAL_IN	Input		Crystal oscillator interface. XTAL_IN is the input, XTAL_OUT is the output.
12	V_c	Input		VCXO control voltage input.
13	SEL	Input	Pulldown	Select pin. LVCMOS/LVTTL interface levels. See Table 3.
14	OE	Input	Pullup	Output enable pin. When HIGH, the output is active. When LOW, the output is in a high impedance state. LVCMOS/LVTTL interface.
16	VCO_SEL	Input	Pullup	VCO select pin. LVCMOS/LVTTL interface levels.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics Table, for typical values.

APPLICATION INFORMATION

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 813321-04 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{CC} , V_{CCA} , and V_{CCO} should be individually connected to the power supply plane through vias, and $0.01\mu\text{F}$ bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{CC} pin and also shows that V_{CCA} requires that an additional 10Ω resistor along with a $10\mu\text{F}$ bypass capacitor be connected to the V_{CCA} pin.

FIGURE 1. POWER SUPPLY FILTERING

RECOMMENDATIONS FOR UNUSED INPUT PINS

INPUTS:

LVC MOS CONTROL PINS:

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A $1\text{k}\Omega$ resistor can be used.

TERMINATION FOR 3.3V LVPECL OUTPUT

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω transmission

lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 2A and 2B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 2A. LVPECL OUTPUT TERMINATION

FIGURE 2B. LVPECL OUTPUT TERMINATION

TERMINATION FOR 2.5V LVPECL OUTPUT

Figure 3A and Figure 3B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{cc} - 2V$. For $V_{cc} = 2.5V$, the $V_{cc} - 2V$ is very close to ground

level. The R3 in Figure 3B can be eliminated and the termination is shown in Figure 3C.

VCXO CRYSTAL SELECTION

Choosing a crystal with the correct characteristics is one of the most critical steps in using a Voltage Controlled Crystal Oscillator (VCXO). The crystal parameters affect the tuning range and accuracy of a

VCXO. Below are the key variables and an example of using the crystal parameters to calculate the tuning range of the VCXO.

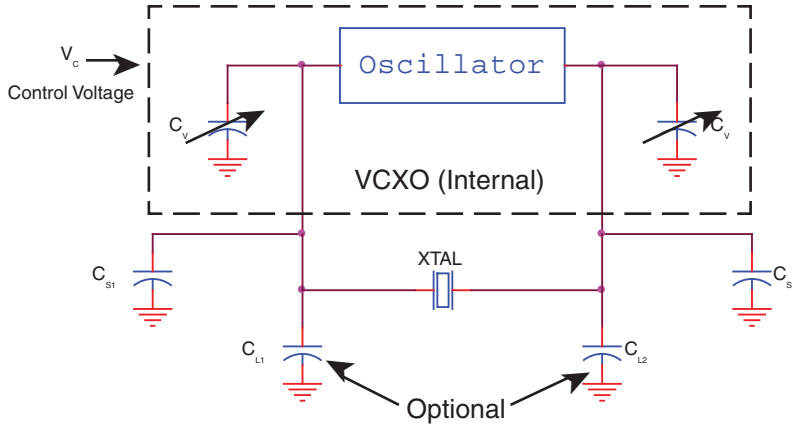

FIGURE 4. VCXO OSCILLATOR CIRCUIT

- V_c - Control voltage used to tune frequency
- C_v - Varactor capacitance, varies due to the change in control voltage
- C_{L1}, C_{L2} - Load tuning capacitance used for fine tuning or centering nominal frequency
- C_{S1}, C_{S2} - Stray Capacitance caused by pads, vias, and other board parasitics

TABLE 6. EXAMPLE CRYSTAL PARAMETERS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
f_N	Nominal Frequency		14		20	MHz
f_T	Frequency Tolerance				± 20	ppm
f_S	Frequency Stability				± 20	ppm
	Operating Temperature Range		0		70	$^{\circ}\text{C}$
C_L	Load Capacitance			12		pF
C_O	Shunt Capacitance			4		pF
C_1, C_2	Pullability Ratio			220	240	
ESR	Equivalent Series Resistance				20	
	Drive Level				1	mW
	Aging @ 25 $^{\circ}\text{C}$		± 3 per year			ppm
	Mode of Operation		Fundamental			

TABLE 7. VARACTOR PARAMETERS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C_{V_LOW}	Low Varactor Capacitance	$V_c = 0V$		6		pF
C_{V_HIGH}	High Varactor Capacitance	$V_c = 3.3V$		11		pF

FORMULAS

$$C_{Low} = \frac{(C_{L1} + C_{S1} + C_{V_Low}) \cdot (C_{L2} + C_{S2} + C_{V_Low})}{(C_{L1} + C_{S1} + C_{V_Low}) + (C_{L2} + C_{S2} + C_{V_Low})}$$

$$C_{High} = \frac{(C_{L1} + C_{S1} + C_{V_High}) \cdot (C_{L2} + C_{S2} + C_{V_High})}{(C_{L1} + C_{S1} + C_{V_High}) + (C_{L2} + C_{S2} + C_{V_High})}$$

- C_{Low} is the effective capacitance due to the low varactor capacitance, load capacitance and stray capacitance.
 C_{Low} determines the high frequency component on the TPR.
- C_{High} is the effective capacitance due to the high varactor capacitance, load capacitance and stray capacitance.
 C_{High} determines the low frequency component on the TPR.

$$Total\ Pull\ Range\ (TPR) = \left(\frac{1}{2 \cdot C_0 / C_1 \cdot \left(1 + \frac{C_{Low}}{C_0}\right)} - \frac{1}{2 \cdot C_0 / C_1 \cdot \left(1 + \frac{C_{High}}{C_0}\right)} \right) \cdot 10^6$$

Absolute Pull Range (APR) = Total Pull Range – (Frequency Tolerance + Frequency Stability + Aging)

EXAMPLE CALCULATIONS

Using the tables and figures above, we can now calculate the TPR and APR of the VCXO using the example crystal parameters. For the numerical example below there were some assumptions made. First, the stray capacitance (C_{S1} , C_{S2}), which is all the excess capacitance due to board parasitic, is 4pF. Second, the expected lifetime of the project is 5 years; hence the inaccuracy due to aging

is ± 15 ppm. Third, though many boards will not require load tuning capacitors (C_{L1} , C_{L2}), it is recommended for long-term consistent performance of the system that two tuning capacitor pads be placed into every design. Typical values for the load tuning capacitors will range from 0 to 4pF.

$$C_{Low} = \frac{(0 + 4pf + 15pf) \cdot (0 + 4pf + 15pf)}{(0 + 4pf + 15pf) + (0 + 4pf + 15pf)} = 9.5pf$$

$$C_{High} = \frac{(0 + 4pf + 27.4pf) \cdot (0 + 4pf + 27.4pf)}{(0 + 4pf + 27.4pf) + (0 + 4pf + 27.4pf)} = 15.7pf$$

$$TPR = \left(\frac{1}{2 \cdot 220 \cdot \left(1 + \frac{9.5pf}{4pf}\right)} - \frac{1}{2 \cdot 220 \cdot \left(1 + \frac{15.7pf}{4pf}\right)} \right) \cdot 10^6 = 212ppm$$

TPR = ± 106 ppm

APR = 106ppm – (20ppm + 20ppm + 15ppm) = ± 51 ppm

The example above will ensure a total pull range of ± 106 ppm with an APR of ± 51 ppm. Many times, board designers may select their own crystal based on their application. If the application requires a tighter APR, a crystal with better pullability

(C0/C1 ratio) can be used. Also, with the equations above, one can vary the frequency tolerance, temperature stability, and aging or shunt capacitance to achieve the required pullability.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 813321-04. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 813321-04 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{CC} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.465V * 130mA = 450mW$

Total Power_{MAX} (3.465V, with output switching) = 450mW + 30mW = **480mW**

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 92.4°C/W per Table 8 below.

Therefore, T_j for an ambient temperature of 70°C with all outputs switching is:

$$70^\circ C + 0.480W * 92.4^\circ C/W = 114.4^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

TABLE 8. THERMAL RESISTANCE θ_{JA} FOR 16-PIN TSSOP, FORCED CONVECTION

θ_{JA} by Velocity (Meters per Second)			
	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	92.4°C/W	88.0°C/W	75.91°C/W

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 5*.

FIGURE 5. LVPECL DRIVER CIRCUIT AND TERMINATION

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CCO} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CCO_MAX} - 0.9V$

$$(V_{CCO_MAX} - V_{OH_MAX}) = 0.9V$$

- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CCO_MAX} - 1.7V$

$$(V_{CCO_MAX} - V_{OL_MAX}) = 1.7V$$

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$Pd_H = [(V_{OH_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) = [(2V - (V_{CCO_MAX} - V_{OH_MAX}))/R_L] * (V_{CCO_MAX} - V_{OH_MAX}) =$$

$$[(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd_L = [(V_{OL_MAX} - (V_{CCO_MAX} - 2V))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) = [(2V - (V_{CCO_MAX} - V_{OL_MAX}))/R_L] * (V_{CCO_MAX} - V_{OL_MAX}) =$$

$$[(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = 30mW$$
