

# 8:1, DIFFERENTIAL-TO-3.3V or 2.5V LVPECL/ECL CLOCK MULTIPLEXER

**ICS853058**

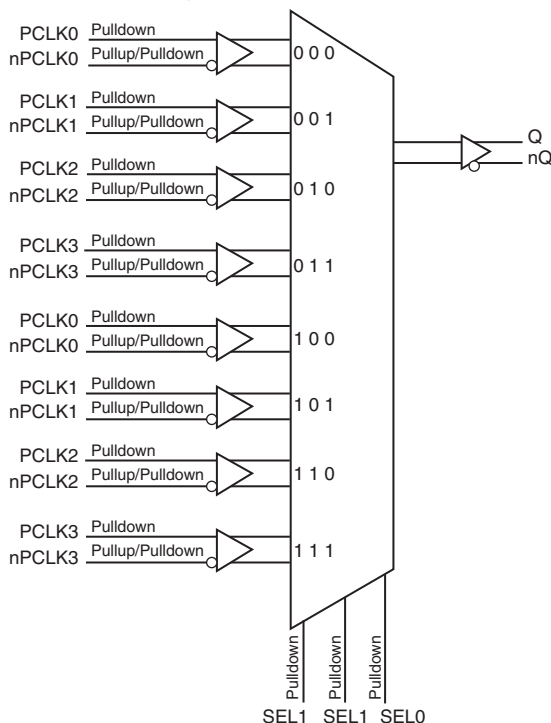

## General Description

The ICS853058 is an 8:1 Differential-to-3.3V or 2.5V LVPECL / ECL Clock Multiplexer which can operate up to 2.8GHz and is a member of the HiPerClockS™ family of High Performance Clock Solutions from IDT. The ICS853058 has 8 differential selectable clock inputs. The PCLK, nPCLK input pairs can accept LVPECL, LVDS, CML or SSTL levels. The fully differential architecture and low propagation delay make it ideal for use in clock distribution circuits. The select pins have internal pulldown resistors. The SEL2 pin is the most significant bit and the binary number applied to the select pins will select the same numbered data input (i.e., 000 selects PCLK0, nPCLK0).

## Features

- High speed 8:1 differential multiplexer
- One differential 3.3V or 2.5V LVPECL output
- Eight selectable differential PCLKx/nPCLKx input pairs
- Differential PCLKx/nPCLKx pairs can accept the following interface levels: LVPECL, LVDS, CML, SSTL
- Maximum output frequency: 2.8GHz
- Translates any single ended input signal to LVPECL levels with resistor bias on nPCLKx input
- RMS phase jitter @ 155.52MHz: 0.212ps (typical)
- Part-to-part skew: 325ps (maximum)
- Propagation delay: 450ps (maximum)
- LVPECL mode operating voltage supply range:  $V_{CC} = 2.375V$  to  $3.465V$ ,  $V_{EE} = 0V$
- ECL mode operating voltage supply range:  $V_{CC} = 0V$ ,  $V_{EE} = -3.465V$  to  $-2.375V$
- $-40^{\circ}C$  to  $85^{\circ}C$  ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages

**Table 1. Pin Descriptions**

Number	Name	Type		Description
1	PCLK0	Input	Pulldown	Non-inverting differential clock input.
2	nPCLK0	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
3	PCLK1	Input	Pulldown	Non-inverting differential clock input.
4	nPCLK1	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
5, 20	$V_{CC}$	Power		Positive supply pins.
6, 7, 8	SEL0, SEL1, SEL2	Input	Pulldown	Clock select input pins. LVCMOS/LVTTL interface levels.
9	PCLK2	Input	Pulldown	Non-inverting differential clock input.
10	nPCLK2	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
11	PCLK3	Input	Pulldown	Non-inverting differential clock input.
12	nPCLK3	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
13	nPCLK4	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
14	PCLK4	Input	Pulldown	Non-inverting differential clock input.
15	nPCLK5	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
16	PCLK5	Input	Pulldown	Non-inverting differential clock input.
17	$V_{EE}$	Power		Negative supply pin.
18, 19	nQ, Q	Output		Differential output pair. LVPECL interface levels.
21	nPCLK6	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
22	PCLK6	Input	Pulldown	Non-inverting differential clock input.
23	nPCLK7	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{CC}/2$ default when left floating.
24	PCLK7	Input	Pulldown	Non-inverting differential clock input.

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

**Table 2. Pin Characteristics**

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$R_{PULLDOWN}$	Pulldown Resistor			75		$k\Omega$
$R_{VCC/2}$	Pullup/Pulldown Resistor			50		$k\Omega$

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device.

These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, $V_{CC}$	5.5V (LVPECL mode, $V_{EE} = 0V$ )
Negative Supply Voltage, $V_{EE}$	-5.5V (ECL mode, $V_{CC} = 0V$ )
Inputs, $V_I$ (LVPECL mode)	-0.5V to $V_{CC} + 0.5V$
Inputs, $V_I$ (ECL mode)	0.5V to $V_{EE} - 0.5V$
Outputs, $I_O$ Continuous Current Surge Current	50mA 100mA
Operating Temperature Range, $T_A$	-40°C to +85°C
Package Thermal Impedance, $\theta_{JA}$	70°C/W (0 mps)
Storage Temperature, $T_{STG}$	-65°C to 150°C

## DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics,  $V_{CC} = 2.375V$  to  $3.465V$ ;  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  to  $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$V_{CC}$	Positive Supply Voltage		2.375	3.3	3.465	V
$I_{EE}$	Power Supply Current				47	mA

**Table 4B. LVCMOS/LVTTL DC Characteristics**,  $V_{CC} = 2.375V$  to  $3.465V$ ;  $V_{EE} = 0V$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$ 

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units

$V_{OL}$	Output Low Voltage; NOTE 3			$V_{CC} - 1.895$		$V_{CC} - 1.670$	V
$V_{SWING}$	Peak-to-Peak Output Voltage Swing			0.6		1.0	V

NOTE 1: Common mode voltage is defined as  $V_{IH}$ .NOTE 2:  $V_{IL}$  should not be less than -0.3V.NOTE 3: Outputs terminated with  $50\Omega$  to  $V_{CC} - 2V$ **Table 4D. ECL DC Characteristics**,  $V_{CC} = 0V$ ,  $V_{EE} = -3.465V$  to  $-2.375V$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$ 

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
$V_{OH}$	Output High Voltage; NOTE 1			-1.225		-0.935	V
$V_{OL}$	Output Low Voltage; NOTE 1			-1.895		-1.67	V
$V_{PP}$	Peak-to-Peak Input Voltage			0.15		1.5	V
$V_{CMR}$	Input High Voltage Common Mode Range; NOTE 2, 3			$V_{EE} + 1.2$		0	V
$I_{IH}$	Input High Current	PCLK[0:7], nPCLK[0:7]	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$			150	$\mu A$
$I_{IL}$	Input Low Current	PCLK[0:7]	$V_{CC} = 3.465V$ or $2.625V$ , $V_{IN} = 0V$	-10			$\mu A$
		nPCLK[0:7]		-150			$\mu A$

NOTE 1: Outputs terminated with  $50\Omega$  to  $V_{CC} - 2V$ .NOTE 2: Common mode voltage is defined as  $V_{IH}$ .NOTE 3:  $V_{IL}$  should not be less than -0.3V

## AC Electrical Characteristics

**Table 5. AC Characteristics**,  $V_{CC} = 0V$ ,  $V_{EE} = -3.465V$  to  $-2.375V$  or  $V_{CC} = 2.375$  to  $3.465V$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
$f_{MAX}$	Output Frequency				2.8	GHz
$f_{jit}$	Buffer Additive Phase Jitter, RMS; refer to Additive Phase Jitter section	155.52MHz, 12kHz – 20MHz		0.212		ps
$t_{PD}$	Propagation Delay; NOTE 1		125		450	ps
$t_{sk(pp)}$	Part-to-Part Skew; NOTE 2, 3				325	ps
$t_{sk(i)}$	Input Skew				75	ps
$t_R / t_F$	Output Rise/Fall Time	20% to 80%	75		220	ps
$MUX_{ISOLATION}$	MUX Isolation	155.52MHz, Input Peak-to-Peak = 800mV		-55		dB

All parameters measured up to 1.3GHz, unless otherwise noted.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as skew between outputs on different devices operating at the same supply voltage and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

NOTE 3: This parameter is defined according with JEDEC Standard 65.

## Additive Phase Jitter

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in the 1Hz band

to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

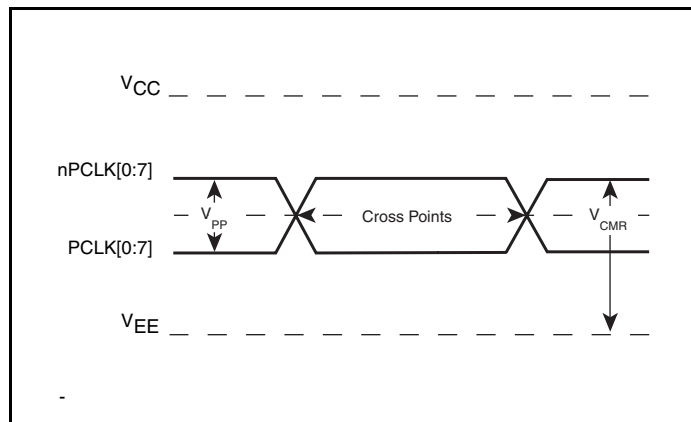

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the

device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

## Application Information

### Wiring the Differential Input to Accept Single Ended Levels

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{CC}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

**Figure 1. Single-Ended Signal Driving Differential Input**

## LVPECL Clock Input Interface

The PCLK /nPCLK accepts LVPECL, CML, SSTL and other differential signals. Both  $V_{\text{SWING}}$  and  $V_{\text{OH}}$  must meet the  $V_{\text{PP}}$  and  $V_{\text{CMR}}$  input requirements. Figures 2A to 2E show interface examples for the HiPerClockS PCLK/nPCLK input driven by the

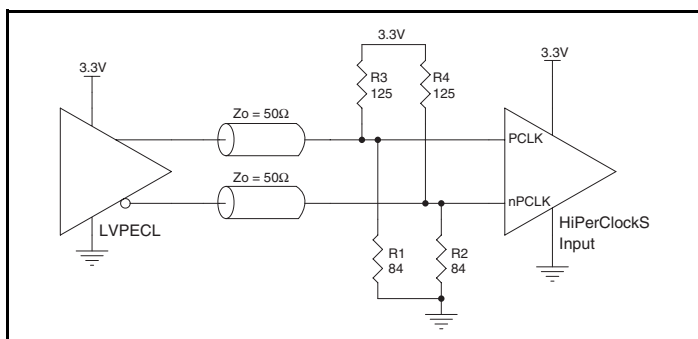

most common driver types. The input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

## Recommendations for Unused Input Pins

### Inputs:

#### PCLK/nPCLK INPUTS

For applications not requiring the use of the differential input, both PCLK and nPCLK can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from CLK to ground.

## Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50 $\Omega$

Figure 3A. 3.3V LVPECL Output Termination

### LVPECL Control Pins

All control pins have internal pull-downs; additional resistance is not required but can be added for additional protection. A 1k $\Omega$  resistor can be used.

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 3A and 3B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 3B. 3.3V LVPECL Output Termination

## Termination for 2.5V LVPECL Outputs

Figure 4A and Figure 4B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating  $50\Omega$  to  $V_{CC} - 2V$ . For  $V_{CC} = 2.5V$ , the  $V_{CC} - 2V$  is very close to

ground level. The  $R3$  in Figure 4B can be eliminated and the termination is shown in Figure 4C.

Figure 4A. 2.5V LVPECL Driver Termination Example

Figure 4B. 2.5V LVPECL Driver Termination Example

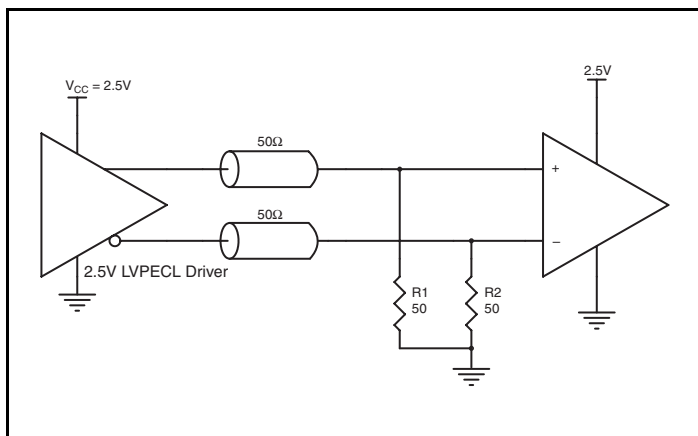

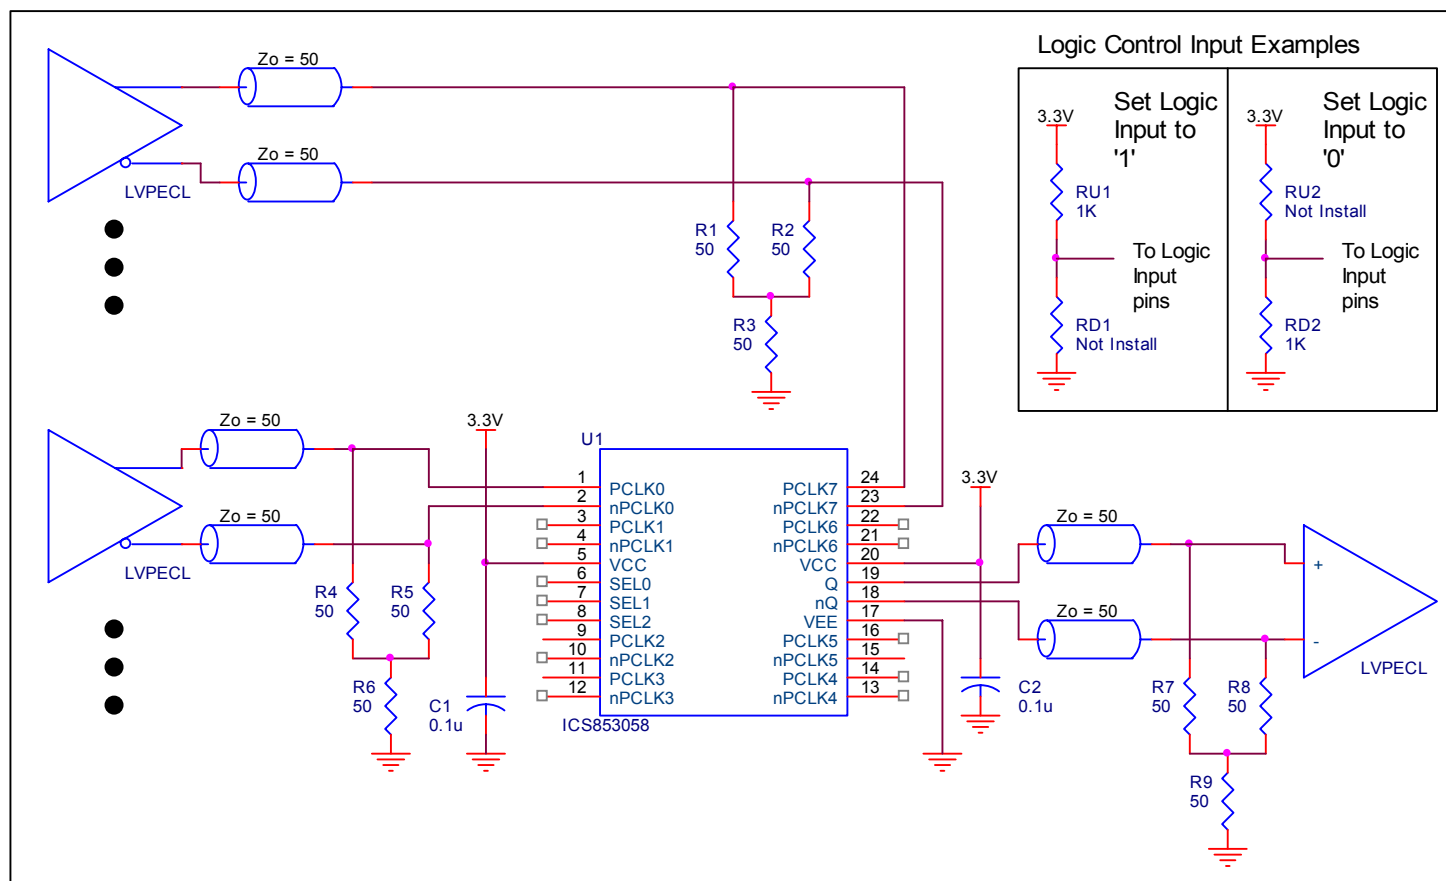

Figure 4C. 2.5V LVPECL Driver Termination Example

An application schematic example of ICS853058 is shown in *Figure 5*. The inputs can accept various types of differential signals. In this example, the inputs are driven by LVPECL drivers. The ICS853058 output is an LVPECL driver. An example of LVPECL terminations is shown in this schematic. Other

termination approaches are available in the LVPECL Termination Application Note. It is recommended at least one decoupling capacitor per power pin. The decoupling capacitor should be low ESR and located as close as possible to the power pin.

### Figure 5. ICS853058 Schematic Example

## Power Considerations

This section provides information on power dissipation and junction temperature for the ICS853058. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS853058 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 47mA = \mathbf{162.86mW}$
- Power (outputs)<sub>MAX</sub> = **30.94mW/Loaded Output pair**

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $162.86mW + 3.94mW = \mathbf{193.8mW}$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 1 meter per second and a multi-layer board, the appropriate value is 65°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$85^\circ C + 0.194W * 65^\circ C/W = 97.6^\circ C$ . This is well below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (single layer or multi-layer).

**Table 6. Thermal Resistance  $\theta_{JA}$  for 24 Lead TSSOP, Forced Convection**

$\theta_{JA}$ by Velocity			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	70°C/W	65°C/W	62°C/W

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

**Figure 6. LVPECL Driver Circuit and Termination**

To calculate worst case power dissipation into the load, use the following equations which assume a  $50\Omega$  load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.935V$   
 $(V_{CC\_MAX} - V_{OH\_MAX}) = 0.935V$
- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.67V$   
 $(V_{CC\_MAX} - V_{OL\_MAX}) = 1.67V$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.935V)/50\Omega] * 0.935V = \mathbf{19.92mW}$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.67V)/50\Omega] * 1.67V = \mathbf{11.2mW}$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = \mathbf{30.94mW}$$
