

DIFFERENTIAL-TO-3.3V, 2.5V LVPECL BUFFER/ DIVIDER W/INTERNAL TERMINATION

ICS889871

GENERAL DESCRIPTION

The ICS889871 is a high speed Differential-to-3.3V, 2.5V LVPECL Buffer/Divider w/Internal Termination and is a member of the HiPerClockS™ family of high performance clock solutions from IDT. The ICS889871 has a selectable $\div 2$, $\div 4$, $\div 8$, $\div 16$ output dividers. The clock input has internal termination resistors, allowing it to interface with several differential signal types while minimizing the number of required external components. The device is packaged in a small, 3mm x 3mm VFQFN package, making it ideal for use on space-constrained boards.

FEATURES

- Three LVPECL outputs
- Frequency divide select options: $\div 2$, $\div 4$, $\div 8$, $\div 16$
- IN, nIN input can accept the following differential input levels: LVPECL, LVDS, CML
- Output frequency: 2GHz (typical)
- Additive phase jitter, RMS: 0.26ps (typical)
- Output skew: 7ps (typical), QB outputs
- Part-to-part skew: 250ps (maximum)
- Propagation Delay: 535ps (typical), QA/nQA outputs
- Supply voltage range: (LVPECL), 2.375V to 3.465V
Supply voltage range: (ECL), -3.465V to -2.375V
- -40°C to 85°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) compliant packages

RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

INPUTS:

SELECT PINS:

All select pins have internal pull-ups and pull-downs; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

OUTPUTS:

LVPECL OUTPUT

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

3.3V LVPECL INPUT WITH BUILT-IN 50 Ω TERMINATIONS INTERFACE

The IN/nIN with built-in 50 Ω terminations accepts LVDS, LVPECL, LVHSTL, CML, SSTL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. *Figures 2A to 2E* show interface examples for the HiPerClockS IN/nIN input with built-in 50 Ω terminations driven by the most common

driver types. The input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 4A. LVPECL OUTPUT TERMINATION

FIGURE 4B. LVPECL OUTPUT TERMINATION

TERMINATION FOR 2.5V LVPECL OUTPUT

Figure 5A and Figure 5B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{cc} - 2V$. For $V_{cc} = 2.5V$, the $V_{cc} - 2V$ is very close to ground

level. The R3 in Figure 5B can be eliminated and the termination is shown in Figure 5C.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS889871. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS889871 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{CC} = 3.3V \pm 10\% = 3.63V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.63V * 55mA = 199.65mW$
- Power (outputs)_{MAX} = **30.94mW/Loaded Output pair**
If all outputs are loaded, the total power is $3 * 30.94mW = 92.82mW$

$$\text{Total Power}_{MAX} (3.465V, \text{ with all outputs switching}) = 199.65mW + 92.82mW = 292.47mW$$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 0 linear feet per minute and a multi-layer board, the appropriate value is 51.5°C/W per Table 6 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.293W * 51.5^\circ C/W = 100.1^\circ C. \text{ This is well below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

θ_{JA} by Velocity (Linear Feet per Minute)

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

FIGURE 6. LVPECL DRIVER CIRCUIT AND TERMINATION

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of $V_{CC} - 2V$.

- For logic high, $V_{OUT} = V_{OH_MAX} = V_{CC_MAX} - 0.935V$

$$(V_{CC_MAX} - V_{OH_MAX}) = 0.935V$$

- For logic low, $V_{OUT} = V_{OL_MAX} = V_{CC_MAX} - 1.67V$

$$(V_{CC_MAX} - V_{OL_MAX}) = 1.67V$$

Pd_H is power dissipation when the output drives high.

Pd_L is the power dissipation when the output drives low.

$$Pd_H = [(V_{OH_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) = [(2V - (V_{CC_MAX} - V_{OH_MAX}))/R_L] * (V_{CC_MAX} - V_{OH_MAX}) = [(2V - 0.935V)/50\Omega] * 0.935V = 19.92mW$$

$$Pd_L = [(V_{OL_MAX} - (V_{CC_MAX} - 2V))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) = [(2V - (V_{CC_MAX} - V_{OL_MAX}))/R_L] * (V_{CC_MAX} - V_{OL_MAX}) = [(2V - 1.67V)/50\Omega] * 1.67V = 11.2mW$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = 30.94mW$$
