DESCRIPTION:

The IDT5T929 generates a high precision FEC (Forward Error Correction) or non-FEC source clock for SONET/SDH systems as well as a source clock for Gigabit Ethernet systems. This device also has clock regeneration capability: it creates a "clean" version of the clock input by using the internal oscillator to square the input clock's rising and falling edges and remove jitter. In the event that the main clock input fails, the device automatically locks to a backup reference clock using a hitless switchover mechanism.

This device detects loss of valid CLKIN and leaves the VCO of the PLL at the last valid frequency while an alternate input REFIN is selected. If CLKIN and REFIN are different frequencies, the multiplication factor will be adjusted to retain the same output frequency.

The IDT5T929 can act as a translator from a differential LVPECL, LVDS, or single-ended LVTTTL input to LVPECL or LVDS outputs. The IDT5T929-10 has LVDS outputs and the IDT5T929-30 has LVPECL outputs.

The two modes of output frequency range are controlled by the SELmode. When SELmode is high or low, the Q_{OUT} is a multiplied version of the input clock while Q_{REG} is a regenerated version of the input clock.

APPLICATIONS:

- Terabit routers
- Gigabit ethernet systems
- SONET / SDH systems
- Digital cross connects
- Optical transceiver modules

NOTE:

- Stresses beyond those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

77.7MHz - 83.4MHz
155.5MHz - 167MHz

NOTE:

1. The PLL will automatically detect the input frequency and adjust the multiply ratio to generate the appropriate output frequency.

LOCK FREQUENCY DETECTOR

The 5T929 will lock to, and track, a valid CLKIN signal; $\overline{\text{LOCK}}$ will be low when this has occurred. If CLKIN fails, the 5T929 PLL will smoothly switch to lock to REFIN without generating any glitches on the output. The fact that the PLL is locked to REFIN rather than CLKIN is indicated by a high state on $\overline{\text{LOCK}}$. When a valid input is then applied to CLKIN, the 5T929 will smoothly switch back to locking on CLKIN, and $\overline{\text{LOCK}}$ will go low. $\overline{\text{LOCK}}$ will also switch to high should the frequency of CLKIN drift close to the limits of the VCO tuning range.

OUTPUT FREQUENCY RANGE

I _{TOT}	Total Power Supply Current	V _{DD} = Max., Q _{OUT} = 622MHz, All outputs unloaded	—	200	mA

NOTES:

- These power consumption characteristics are for all the valid input interfaces and cover the worst case input and output interface combinations.
