DESCRIPTION:

The IDT5T940 generates a high precision FEC (Forward Error Correction) or non-FEC source clock for SONET/SDH systems as well as a source clock for Gigabit Ethernet systems. This device also has clock regeneration capability: it creates a "clean" version of the clock input by using the internal oscillator to square the input clock's rising and falling edges and remove jitter. In the event that the main clock input fails, the device automatically locks to a backup reference clock using a hitless switchover mechanism.

This device detects loss of valid CLKIN and leaves the VCO of the PLL at the last valid frequency while an alternate input REFIN is selected. If CLKIN and REFIN are different frequencies, the multiplication factor will be adjusted to retain the same output frequency.

The IDT5T940 can act as a translator from a differential LVPECL, LVDS, or single-ended LVTTTL input to LVPECL or LVDS outputs. The IDT5T940-10 has LVDS outputs and the IDT5T940-30 has LVPECL outputs.

The three modes of output frequency range are controlled by the SELmode, which is a 3-level pin. When SELmode is high or low, the Q_{OUT} is a multiplied version of the input clock while Q_{REG} is a regenerated version of the input clock. When SELmode is mid, the Q_{OUT} is a multiplied version of the input clock while Q_{REG} is Q_{OUT}/4.

The IDT5T940 features a selectable loop bandwidth.

APPLICATIONS:

- Terabit routers
- Gigabit ethernet systems
- SONET / SDH systems
- Digital cross connects
- Optical transceiver modules

LOCK FREQUENCY DETECTOR

The 5T940 will lock to, and track, a valid CLKIN signal; LOCK will be low when this has occurred. If CLKIN fails, the 5T940 PLL will smoothly switch to lock to REFIN without generating any glitches on the output. The fact that the PLL is locked to REFIN rather than CLKIN is indicated by a high state on LOCK. When a valid input is then applied to CLKIN, the 5T940 will smoothly switch back to locking on CLKIN, and LOCK will go low. LOCK will also switch to high should the frequency of CLKIN drift close to the limits of the VCO tuning range.

POWER SUPPLY CHARACTERISTICS^(1,2)

Symbol	Parameter	Test Conditions	Typ.	Max	Unit
I _{DD_PD}	Power Supply Current	V _{DD} = Max., $\overline{PD}$ = GND, All outputs unloaded	—	50	μA
ΔI _{DD}	Power Supply Current per Input HIGH (LVTTTL inputs only)	V _{DD} = Max., V _{IN} = 2.375V	—	100	μA
I _{TOT}	Total Power Supply Current	V _{DD} = Max., Q _{OUT} = 622MHz, All outputs unloaded	—	200	mA

NOTES:

- These power consumption characteristics are for all the valid input interfaces and cover the worst case input and output interface combinations.
- As a general requirement, these parts must be capable of operating at the maximum frequency under a nominal load at a reasonable operating temperature. That means that these parts must not burn up under extended use in a typical application.

DC ELECTRICAL CHARACTERISTICS OVER OPERATING RANGE

V _{IHH}	Input HIGH Voltage Level ⁽¹⁾	3-Level Inputs Only	V _{DD} - 0.4	—	V
V _{IMM}	Input MID Voltage Level ⁽¹⁾	3-Level Inputs Only	V _{DD} /2 - 0.2	V _{DD} /2 + 0.2	V
V _{ILL}	Input LOW Voltage Level ⁽¹⁾	3-Level Inputs Only	—	0.4	V

		V _{IN} = V _{DD} /2 MID Level	-50	+50	
		V _{IN} = GND LOW Level	-200	—	

NOTE:

- These inputs are normally wired to V_{DD}, GND, or left floating. Internal termination resistors bias unconnected inputs to V_{DD}/2. If these inputs are switched dynamically after powerup, the function and timing of the outputs may be glitched, and the PLL may require additional t_{AQ} time before all datasheet limits are achieved.
