

# 18Mb Pipelined DDR™II SRAM Burst of 2

**Advance  
Information**  
**IDT71P71204**  
**IDT71P71104**  
**IDT71P71804**  
**IDT71P71604**

## Features

- ◆ 18Mb Density (2Mx8, 2Mx9, 1Mx18, 512kx36)
- ◆ Common Read and Write Data Port
- ◆ Dual Echo Clock Output
- ◆ 2-Word Burst on all SRAM accesses
- ◆ Multiplexed Address Bus
  - One Read or One Write request per clock cycle
- ◆ DDR (Double Data Rate) Data Bus
  - Two word bursts data per clock
- ◆ Depth expansion through Control Logic
- ◆ HSTL (1.5V) inputs that can be scaled to receive signals from 1.4V to 1.9V.
- ◆ Scalable output drivers
  - Can drive HSTL, 1.8V TTL or any voltage level from 1.4V to 1.9V.
  - Output Impedance adjustable from 35 ohms to 70 ohms
- ◆ 1.8V Core Voltage (VDD)
- ◆ 165-ball, 1.0mm pitch, 13mm x 15mm fBGA Package
- ◆ JTAG Interface

## Description

The IDT DDRII™ Burst of two SRAMs are high-speed synchronous memories with a double-data-rate (DDR), bidirectional data port. This scheme allows maximization of the bandwidth on the data bus by passing two data items per clock cycle. The address bus operates at single data rate speeds, allowing the user to fan out addresses and ease system design while maintaining maximum performance on data transfers.

The DDRII has scalable output impedance on its data output bus and echo clocks, allowing the user to tune the bus for low noise and high performance.

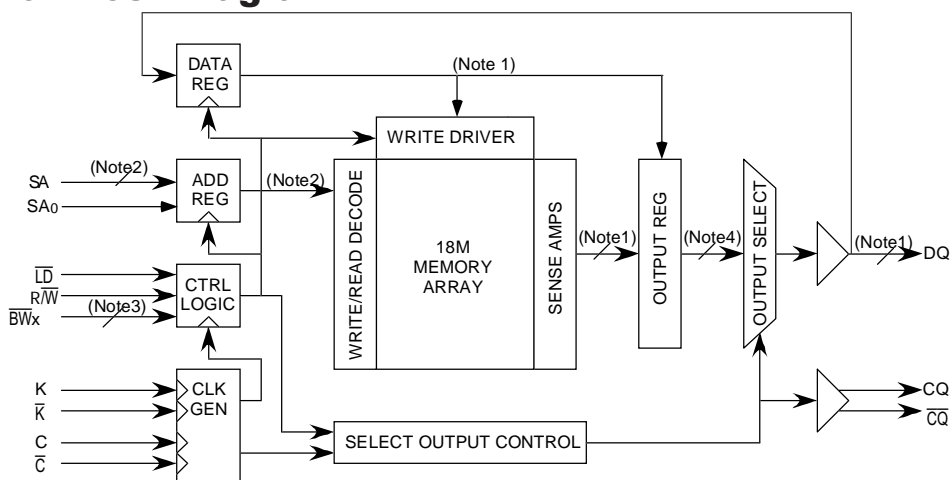

All interfaces of the DDRII SRAM are HSTL, allowing speeds beyond SRAM devices that use any form of TTL interface. The interface can be scaled to higher voltages (up to 1.9V) to interface with 1.8V systems if necessary. The device has a VDDQ and a separate Vref, allowing the user to designate the interface operational voltage, independent of the device core voltage of 1.8V VDD. The output impedance control allows the user to adjust the drive strength to adapt to a wide range of loads and transmission lines.

## Clocking

The DDRII SRAM has two sets of input clocks, namely the K,  $\bar{K}$  clocks and the C,  $\bar{C}$  clocks. In addition, the DDRII has an output "echo" clock, CQ,  $\bar{CQ}$ .

The K and  $\bar{K}$  clocks are the primary device input clocks. The K clock is used to clock in the control signals ( $\bar{LD}$ , R/W and  $\bar{BWx}$  or  $\bar{NWx}$ ), the address, and the first word of the data burst during a write operation.

## Functional Block Diagram

### Notes

- 1) Represents 8 data signal lines for x8, 9 signal lines for x9, 18 signal lines for x18, and 36 signal lines for x36
- 2) Represents 20 address signal lines for x8 and x9, 19 address signal lines for x18, and 18 address signal lines for x36.
- 3) Represents 1 signal line for x9, 2 signal lines for x18, and four signal lines for x36. On x8 parts, the  $\bar{BW}$  is a "nibble write" and there are 2 signal lines.
- 4) Represents 16 data signal lines for x8, 18 signal lines for x9, 36 signal lines for x18, and 72 signal lines for x36.

**MAY 2004**

The  $\bar{K}$  clock is used to clock in the control signals ( $\bar{B}\bar{W}x$  or  $\bar{N}\bar{W}x$ ), and the second word of the data burst during a write operation. The K and  $\bar{K}$  clocks are also used internally by the SRAM. In the event that the user disables the C and  $\bar{C}$  clocks, the K and  $\bar{K}$  clocks will also be used to clock the data out of the output register and generate the echo clocks.

The C and  $\bar{C}$  clocks may be used to clock the data out of the output register during read operations and to generate the echo clocks. C and  $\bar{C}$  must be presented to the SRAM within the timing tolerances. The output data from the DDRII will be closely aligned to the C and  $\bar{C}$  input, through the use of an internal DLL. When C is presented to the DDRII SRAM, the DLL will have already internally clocked the first data word to arrive at the device output simultaneously with the arrival of the C clock. The  $\bar{C}$  and second data word of the burst will also correspond.

### Single Clock Mode

The DDRII SRAM may be operated with a single clock pair. C and  $\bar{C}$  may be disabled by tying both signals high, forcing the outputs and echo clocks to be controlled instead by the K and  $\bar{K}$  clocks.

### DLL Operation

The DLL in the output structure of the DDRII SRAM can be used to closely align the incoming clocks C and  $\bar{C}$  with the output of the data, generating very tight tolerances between the two. The user may disable the DLL by holding  $\bar{Doff}$  low. With the DLL off, the C and  $\bar{C}$  (or K and  $\bar{K}$  if C and  $\bar{C}$  are not used) will directly clock the output register of the SRAM. With the DLL off, there will be a propagation delay from the time the clock enters the device until the data appears at the output.

### Echo Clock

The echo clocks, CQ and  $\bar{C}\bar{Q}$ , are generated by the C and  $\bar{C}$  clocks (or K,  $\bar{K}$  if C,  $\bar{C}$  are disabled). The rising edge of C generates the rising edge of CQ, and the falling edge of  $\bar{C}\bar{Q}$ . The rising edge of  $\bar{C}$  generates the rising edge of  $\bar{C}\bar{Q}$  and the falling edge of CQ. This scheme improves the correlation of the rising and falling edges of the echo clock and will improve the duty cycle of the individual signals.

The echo clock is very closely aligned with the data, guaranteeing that the echo clock will remain closely correlated with the data, within the tolerances designated.

### Read and Write Operations

Read operations are initiated by holding Read/Write control input (R/W) high, the load control input ( $\bar{LD}$ ) low and presenting the read address to the address port during the rising edge of K, which will latch the address. The data will then be read and will appear at the device output at the designated time in correspondence with the C and  $\bar{C}$  clocks.

Write operations are initiated by holding the Read/Write control input (R/W) low, the load control input ( $\bar{LD}$ ) low and presenting the write address to the address port during the rising edge of K, which will latch the address. On the following rising edge of K, the first word of the two word burst must be present on the data input bus DQ[x:0], along with the appropriate byte write or nibble write ( $\bar{B}\bar{W}$  or  $\bar{N}\bar{W}$ ) inputs. On the following rising edge of  $\bar{K}$ , the second half of the data write burst will be accepted at the device input with the designated ( $\bar{B}\bar{W}$  or  $\bar{N}\bar{W}$ ) inputs.

DDRII devices internally store two words of the burst as a single, wide word and will retain their order in the burst. The x8 and x9 DDRII devices do not have the ability to address to the single word level or reverse the burst order; however the byte and nibble write

signals can be used to prevent writing any byte or individual nibbles, or combined to prevent writing one word of the burst. The x18 and x36 DDRII devices have the ability to address to the individual word level using the SA0 address, but the burst will continue in a linear sequence and wrap back on itself. The address will not increment to the next higher burst address location, but instead will return to its own lower words within the burst location. Similarly when reading x18 and x36 DDRII devices, the read burst will begin at the designated address, but if the burst is started at any other position than the first word of the burst, the burst will wrap back on itself and read the first locations before completing.

### Output Enables

The DDRII SRAM automatically enables and disables the DQ[X:0] outputs. When a valid read is in progress, and data is present at the output, the output will be enabled. If no valid data is present at the output (read not active), the output will be disabled (high impedance). The echo clocks will remain valid at all times and cannot be disabled or turned off. During power-up the DQ outputs will come up in a high impedance state.

### Programmable Impedance

An external resistor, RQ, must be connected between the ZQ pin on the SRAM and Vss to allow the SRAM to adjust its output drive impedance. The value of RQ must be 5X the value of the intended drive impedance of the SRAM. The allowable range of RQ to guarantee impedance matching with a tolerance of +/- 10% is between 175 ohms and 350 ohms, with  $V_{DDQ} = 1.5V$ . The output impedance is adjusted every 1024 clock cycles to correct for drifts in supply voltage and temperature. If the user wishes to drive the output impedance of the SRAM to its lowest value, the ZQ pin may be tied to  $V_{DDQ}$ .

## Pin Definitions

Symbol	Pin Function	Description
DQ[X:0]	Input/Output Synchronous	Data I/O signals. Data inputs are sampled on the rising edge of K and $\bar{K}$ during valid write operations. Data outputs are driven during a valid read operation. The outputs are aligned with the rising edge of both C and $\bar{C}$ during normal operation. When operating in a single clock mode (C and $\bar{C}$ tied high), the outputs are aligned with the rising edge of both K and $\bar{K}$ . When a Read operation is not initiated or $\bar{LD}$ is high (deselected) during the rising edge of K, DQ[X:0] are automatically driven to high impedance after any previous read operation in progress completes. 2M x 8 -- DQ[7:0] 2M x 9 -- DQ[8:0] 1M x 18 -- DQ[17:0] 512K x 36 -- DQ[35:0]
$\bar{BW}_0, \bar{BW}_1, \bar{BW}_2, \bar{BW}_3$	Input Synchronous	Byte Write Select 0, 1, 2, and 3 are active LOW. Sampled on the rising edge of the K and again on the rising edge of $\bar{K}$ clocks during write operations. Used to select which byte is written into the device during the current portion of the write operations. Bytes not written remain unaltered. All the byte writes are sampled on the same edge as the data. Deselecting a Byte Write Select will cause the corresponding byte of data to be ignored and not written in to the device. 2M x 9 -- $\bar{BW}_0$ controls DQ[8:0] 1M x 18 -- $\bar{BW}_0$ controls DQ[8:0] and $\bar{BW}_1$ controls DQ[17:9] 512K x 36 -- $\bar{BW}_0$ controls DQ[8:0], $\bar{BW}_1$ controls DQ[17:9], $\bar{BW}_2$ controls DQ[26:18] and $\bar{BW}_3$ controls DQ[35:27]
$\bar{NW}_0, \bar{NW}_1$	Input Synchronous	Nibble Write Select 0 and 1 are active LOW. Available only on x8 bit parts instead of Byte Write Selects. Sampled on the rising edge of the K and $\bar{K}$ clocks during write operations. Used to select which nibble is written into the device during the current portion of the write operations. Nibbles not written remain unaltered. All the nibble writes are sampled on the same edge as the data. Deselecting a Nibble Write Select will cause the corresponding nibble of data to be ignored and not written in to the device.
SA	Input Synchronous	Address Inputs. Addresses are sampled on the rising edge of K clock during active read or write operations.
SA <sub>0</sub>	Input Synchronous	Burst count address bit on x18 and x36 DDRII devices. This bit allows reversing the burst order in read or write operations, or addressing to the individual word of a burst.
$\bar{LD}$	Input Synchronous	Load Control Logic: Sampled on the rising edge of K. If $\bar{LD}$ is low, a two word burst read or write operation will initiate as designated by the R/ $\bar{W}$ input. If $\bar{LD}$ is high during the rising edge of K, operations in progress will complete, but new operations will not be initiated.
R/ $\bar{W}$	Input Synchronous	Read or Write Control Logic. If $\bar{LD}$ is low during the rising edge of K, the R/ $\bar{W}$ indicates whether a new operation should be a read or write. If R/ $\bar{W}$ is high, a read operation will be initiated, if R/ $\bar{W}$ is low, a write operation will be initiated. If the $\bar{LD}$ input is high during the rising edge of K, the R/ $\bar{W}$ input will be ignored.
C	Input Clock	Positive Output Clock Input. C is used in conjunction with $\bar{C}$ to clock out the Read data from the device. C and $\bar{C}$ can be used together to deskew the flight times of various devices on the board back to the controller. See application example for further details.
$\bar{C}$	Input Clock	Negative Output Clock Input. $\bar{C}$ is used in conjunction with C to clock out the Read data from the device. C and $\bar{C}$ can be used together to deskew the flight times of various devices on the board back to the controller. See application example for further details.
K	Input Clock	Positive Input Clock. The rising edge of K is used to capture synchronous inputs to the device and to drive out data through DQ[X:0] when in single clock mode. All accesses are initiated on the rising edge of K.
$\bar{K}$	Input Clock	Negative Input Clock. $\bar{K}$ is used to capture synchronous inputs being presented to the device and to drive out data through DQ[X:0] when in single clock mode.
CQ, $\bar{CQ}$	Output Clock	Synchronous Echo clock outputs. The rising edges of these outputs are tightly matched to the synchronous data outputs and can be used as a data valid indication. These signals are free running and do not stop when the output data is three stated.
ZQ	Input	Output Impedance Matching Input. This input is used to tune the device outputs to the system data bus impedance. DQ[X:0] output impedance is set to $0.2 \times R_Q$ , where $R_Q$ is a resistor connected between ZQ and ground. Alternately, this pin can be connected directly to VDDQ, which enables the minimum impedance mode. This pin cannot be connected directly to GND or left unconnected.

6112 b1 02a

## Pin Definitions continued

Symbol	Pin Function	Description
$\overline{\text{Doff}}$	Input	DLL Turn Off. When low this input will turn off the DLL inside the device. The AC timings with the DLL turned off will be different from those listed in this data sheet. There will be an increased propagation delay from the incidence of C and $\overline{\text{C}}$ to DQ, or K and $\overline{\text{K}}$ to DQ as configured. The propagation delay is not a tested parameter, but will be similar to the propagation delay of other SRAM devices in this speed grade.
TDO	Output	TDO pin for JTAG
TCK	Input	TCK pin for JTAG.
TDI	Input	TDI pin for JTAG. An internal resistor will pull TDI to $V_{DD}$ when the pin is unconnected.
TMS	Input	TMS pin for JTAG. An internal resistor will pull TMS to $V_{DD}$ when the pin is unconnected.
NC	No Connect	No connects inside the package. Can be tied to any voltage level
$V_{REF}$	Input Reference	Reference Voltage input. Static input used to set the reference level for HSTL inputs and outputs as well as AC measurement points.
$V_{DD}$	Power Supply	Power supply inputs to the core of the device. Should be connected to a 1.8V power supply.
$V_{SS}$	Ground	Ground for the device. Should be connected to ground of the system.
$V_{DDQ}$	Power Supply	Power supply for the outputs of the device. Should be connected to a 1.5V power supply for HSTL or scaled to the desired output voltage.

## Write Descriptions<sup>(1,2)</sup>

Signal	$\overline{BW}_0$	$\overline{BW}_1$	$\overline{BW}_2$	$\overline{BW}_3$	$\overline{NW}_0$	$\overline{NW}_1$
Write Byte 0	L	X	X	X	X	X
Write Byte 1	X	L	X	X	X	X
Write Byte 2	X	X	L	X	X	X
Write Byte 3	X	X	X	L	X	X
Write Nibble 0	X	X	X	X	L	X
Write Nibble 1	X	X	X	X	X	L

6112 tbl 09

### NOTES:

- 1) All byte write ( $\overline{BW}_x$ ) and nibble write ( $\overline{NW}_x$ ) signals are sampled on the rising edge of K and again on  $\overline{K}$ . The data that is present on the data bus in the designated byte/nibble will be latched into the input if the corresponding  $\overline{BW}_x$  or  $\overline{NW}_x$  is held low. The rising edge of K will sample the first byte/nibble of the two word burst and the rising edge of  $\overline{K}$  will sample the second byte/nibble of the two word burst.
- 2) The availability of the  $\overline{BW}_x$  or  $\overline{NW}_x$  on designated devices is described in the pin description table.
- 3) The DDRII Burst of two SRAM has data forwarding. A read request that is initiated on the cycle following a write request to the same address will produce the newly written data.

## Linear Burst Sequence Table<sup>(1,2)</sup>

SA <sub>0</sub>	a	b
0	0	1
1	1	0

### NOTE:

6112 tbl 22

1. SA<sub>0</sub> is the address presented giving the burst sequence a,b.
2. SA<sub>0</sub> is only available on the x18 and x36-bit devices.

6112 drw 20

## Absolute Maximum Ratings<sup>(1) (2)</sup>

Symbol	Rating	Value	Unit
V <sub>TERM</sub>	Supply Voltage on V <sub>DD</sub> with Respect to GND	-0.5 to +2.9	V
V <sub>TERM</sub>	Supply Voltage on V <sub>DDQ</sub> with Respect to GND	-0.5 to V <sub>DD</sub> +0.3	V
V <sub>TERM</sub>	Voltage on Input terminals with respect to GND	-0.5 to V <sub>DD</sub> +0.3	V
V <sub>TERM</sub>	Voltage on Output and I/O terminals with respect to GND.	-0.5 to V <sub>DDQ</sub> +0.3	V
T <sub>BIAS</sub>	Temperature Under Bias	-55 to +125	°C
T <sub>STG</sub>	Storage Temperature	-65 to +150	°C
I <sub>OUT</sub>	Continuous Current into Outputs	± 20	mA

### NOTES:

6112 tbl 05

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>DDQ</sub> must not exceed V<sub>DD</sub> during normal operation.

## Capacitance (T<sub>A</sub> = +25°C, f = 1.0MHz)<sup>(1)</sup>

Symbol	Parameter	Conditions	Max.	Unit
C <sub>IN</sub>	Input Capacitance	V <sub>DD</sub> = 1.8V V <sub>DDQ</sub> = 1.5V	5	pF
C <sub>CLK</sub>	Clock Input Capacitance		6	pF
C <sub>O</sub>	Output Capacitance		7	pF

### NOTE:

6112 tbl 06

- Tested at characterization and retested after any design or process change that may affect these parameters.

## Recommended DC Operating and Temperature Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>DD</sub>	Power Supply Voltage	1.7	1.8	1.9	V
V <sub>DDQ</sub>	I/O Supply Voltage	1.4	1.5	1.9	V
V <sub>SS</sub>	Ground	0	0	0	V
V <sub>REF</sub>	Input Reference Voltage	0.68	V <sub>DDQ</sub> /2	0.95	V
T <sub>A</sub>	Ambient Temperature <sup>(1)</sup>	0	-	+70	°C

### NOTE:

6112 tbl 04

- During production testing, the case temperature equals the ambient temperature.

## DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range ( $V_{DD} = 1.8 \pm 100\text{mV}$ , $V_{DDQ} = 1.4\text{V}$ to $1.9\text{V}$ )

Parameter	Symbol	Test Conditions	Min	Max	Unit	Note
Input Leakage Current	IIL	$V_{DD} = \text{Max } V_{IN} = V_{SS} \text{ to } V_{DDQ}$	-10	+10	$\mu\text{A}$

Output High Voltage	VOH2	$I_{OH} = -0.1\text{mA}$	$V_{DDQ} - 0.2$	$V_{DDQ}$	V	5
Output Low Voltage	VOL2	$I_{OL} = 0.1\text{mA}$	$V_{SS}$	0.2	V	6

6112 tbl 10c

### NOTES:

- Operating Current is measured at 100% bus utilization.
- Standby Current is only after all pending read and write burst operations are completed.
- Outputs are impedance-controlled.  $I_{OH} = -(V_{DDQ}/2)/(R_Q/5)$  and is guaranteed by device characterization for  $175\Omega \leq R_Q < 350\Omega$ . This parameter is tested at  $R_Q = 250\Omega$ , which gives a nominal  $50\Omega$  output impedance.
- Outputs are impedance-controlled.  $I_{OL} = (V_{DDQ}/2)/(R_Q/5)$  and is guaranteed by device characterization for  $175\Omega \leq R_Q < 350\Omega$ . This parameter is tested at  $R_Q = 250\Omega$ , which gives a nominal  $50\Omega$  output impedance.
- This measurement is taken to ensure that the output has the capability of pulling to the  $V_{DDQ}$  rail, and is not intended to be used as an impedance measurement point.
- This measurement is taken to ensure that the output has the capability of pulling to  $V_{SS}$ , and is not intended to be used as an impedance measurement point.
- Programmable Impedance Mode.

## Input Electrical Characteristics Over the Operating Temperature and Supply Voltage Range ( $V_{DD} = 1.8 \pm 100\text{mV}$ , $V_{DDQ} = 1.4\text{V}$ to $1.9\text{V}$ )

PARAMETER	SYMBOL	MIN	MAX	UNIT	NOTES
Input High Voltage, DC	$V_{IH}(\text{DC})$	$V_{REF} + 0.1$	$V_{DDQ} + 0.3$	V	1,2
Input Low Voltage, DC	$V_{IL}(\text{DC})$	-0.3	$V_{REF} - 0.1$	V	1,3
Input High Voltage, AC	$V_{IH}(\text{AC})$	$V_{REF} + 0.2$	-	V	4,5
Input Low Voltage, AC	$V_{IL}(\text{AC})$	-	$V_{REF} - 0.2$	V	4,5

### NOTES:

6112 tbl 10d

- These are DC test criteria. DC design criteria is  $V_{REF} \pm 50\text{mV}$ . The AC  $V_{IH}/V_{IL}$  levels are defined separately for measuring timing parameters.
- $V_{IL}(\text{Min}) \text{ DC} = -0.3\text{V}$ ,  $V_{IL}(\text{Min}) \text{ AC} = -0.5\text{V}$  (pulse width  $\leq 20\% \text{ t}_{KH\text{KH}}(\text{min})$ )
- $V_{IH}(\text{Max}) \text{ DC} = V_{DDQ} + 0.3$ ,  $V_{IH}(\text{Max}) \text{ AC} = V_{DD} + 0.5\text{V}$  (pulse width  $\leq 20\% \text{ t}_{KH\text{KH}}(\text{min})$ )
- This condition is for AC function test only, not for AC parameter test.
- To maintain a valid level, the transitioning edge of the input must:
  - Sustain a constant slew rate from the current AC level through the target AC level,  $V_{IL}(\text{AC})$  or  $V_{IH}(\text{AC})$
  - Reach at least the target AC level.
  - After the AC target level is reached, continue to maintain at least the target DC level,  $V_{IL}(\text{DC})$  or  $V_{IH}(\text{DC})$

## Overshoot Timing

## Undershoot Timing

## AC Test Load

## AC Test Conditions

Parameter	Symbol	Value	Unit
Core Power Supply Voltage	$V_{DD}$	1.7-1.9	V
Output Power Supply Voltage	$V_{DDQ}$	1.4-1.9	V

6112 B1 11

### NOTES:

- Cycle to cycle period jitter is the variance from clock rising edge to the next expected clock rising edge, as defined per JEDEC Standard No.65 (EIA/JESD65) pg.10
- V<sub>dd</sub> slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once V<sub>dd</sub> and input clock are stable.
- If C,  $\bar{C}$  are tied High, K,  $\bar{K}$  become the references for C,  $\bar{C}$  timing parameters.
- To avoid bus contention, at a given voltage and temperature t<sub>CHQX1</sub> is bigger than t<sub>CHQZ</sub>.  
The specs as shown do not imply bus contention because t<sub>CHQX1</sub> is a MIN parameter that is worse case at totally different test conditions (0°C, 1.9V) than t<sub>CHQZ</sub>, which is a MAX parameter (worst case at 70°C, 1.7V)  
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.
- This parameter is guaranteed by device characterization, but not production tested.
- All address inputs must meet the specified setup and hold times for all latching clock edges.
- Control signals are  $\bar{R}$ , W, BW<sub>0</sub>, BW<sub>1</sub> and (NW<sub>0</sub>, NW<sub>1</sub>, for x8) and (BW<sub>2</sub>, BW<sub>3</sub> also for x36)
- During production testing, the case temperature equals T<sub>A</sub>.
- Clock High Time (t<sub>KHKL</sub>) and Clock Low Time (t<sub>KLKH</sub>) should be within 40% to 60% of the cycle time (t<sub>KHKH</sub>).
- Clock to clock time (t<sub>KHKH</sub>) and  $\bar{C}$ lock to clock time (t $\bar{K}$ H $\bar{K}$ H) should be within 45% to 55% of the cycle time (t<sub>KHKH</sub>).

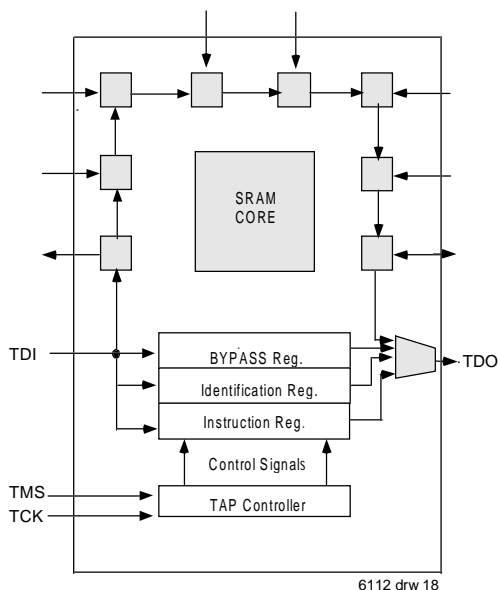

[illegible]

1. If a  $\overline{R}/\overline{W}$  is low on the next rising edge of K after a read request, the device automatically performs a NOP (No Operation.)
2. The second NOP cycle is not necessary for correct device operation; however, at high clock frequencies, it may be required to prevent the bus contention.

## IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port (TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up; therefore, the TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to VSS to preclude a mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected, but they may also be tied to VDD through a resistor. TDO should be left unconnected.

### JTAG Block Diagram

### JTAG Instruction Coding

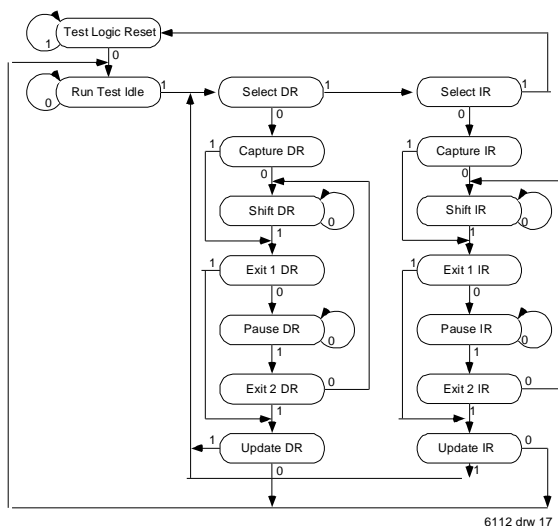

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	
0	0	0	IDCODE	Identification register	2
0	1	0	SAMPLE-Z	Boundary Scan Register	1
0	1	1	RESERVED	Do Not Use	5
1	0	0	SAMPLE/PRELOAD	Boundary Scan register	4
1	0	1	RESERVED	Do Not Use	5
1	1	0	RESERVED	Do Not Use	5
1	1	1	BYPASS	Bypass Register	3

6112 tbl 13

#### NOTE:

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
2. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
3. Bypass register is initialized to Vss when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
4. SAMPLE instruction does not place output pins in Hi-Z.
5. This instruction is reserved for future use.

Power Supply Voltage	VDD	1.7	1.8	1.9	V	
Input High Level	V <sub>IH</sub>	1.3	-	VDD+0.3	V	
Input Low Level	V <sub>IL</sub>	-0.3	-	0.5	V	
Output High Voltage (I <sub>OH</sub> = -1mA)	V <sub>OH</sub>	VDDQ - 0.2	-	VDDQ	V	1
Output Low Voltage (I <sub>OL</sub> = 1mA)	V <sub>OL</sub>	VSS	-	0.2	V	1

NOTE:

6112 tbl 19

- The output impedance of TDO is set to 50 ohms (nominal process) and does not vary with the external resistor connected to ZQ.

## JTAG AC Test Conditions

Parameter	Symbol	Min	Unit	Note
Input High/Low Level	V <sub>IH</sub> /V <sub>IL</sub>	1.3/0.5	V	
Input Rise/Fall Time	TR/TF	1.0/1.0	ns	
Input and Output Timing Reference Level		VDDQ/2	V	1

NOTE:

6112 tbl 20

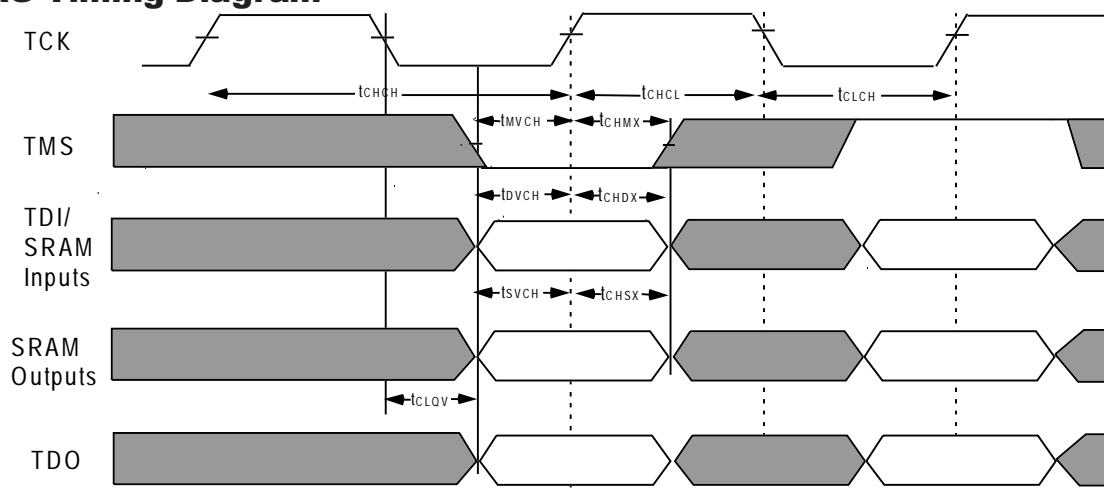

- See AC test load on page 12.

## JTAG AC Characteristics

Parameter	Symbol	Min	Max	Unit	Note
TCK Cycle Time	t <sub>CHCH</sub>	50	-	ns	
TCK High Pulse Width	t <sub>CHCL</sub>	20	-	ns	
TCK Low Pulse Width	t <sub>CLCH</sub>	20	-	ns	
TMS Input Setup Time	t <sub>MVCH</sub>	5	-	ns	
TMS Input Hold Time	t <sub>CHMX</sub>	5	-	ns	
TDI Input Setup Time	t <sub>DVCH</sub>	5	-	ns	
TDI Input Hold Time	t <sub>CHDX</sub>	5	-	ns	
SRAM Input Setup Time	t <sub>SVCH</sub>	5	-	ns	
SRAM Input Hold Time	t <sub>CHSX</sub>	5	-	ns	
Clock Low to Output Valid	t <sub>CLQV</sub>	0	10	ns
