

2.5V CMOS Static RAM 1 Meg (64K x 16-Bit)

IDT71T016SA

Features

- ♦ 64K x 16 advanced high-speed CMOS Static RAM
- ♦ Equal access and cycle times
 - Commercial: 10/12/15/20ns
 - Industrial: 12/15/20ns
- ♦ One Chip Select plus one Output Enable pin
- ♦ Bidirectional data inputs and outputs directly LVTTTL-compatible
- ♦ Low power consumption via chip deselect
- ♦ Upper and Lower Byte Enable Pins
- ♦ Single 2.5V power supply
- ♦ Available in 44-pin Plastic SOJ, 44-pin TSOP, and 48-Ball Plastic FBGA packages

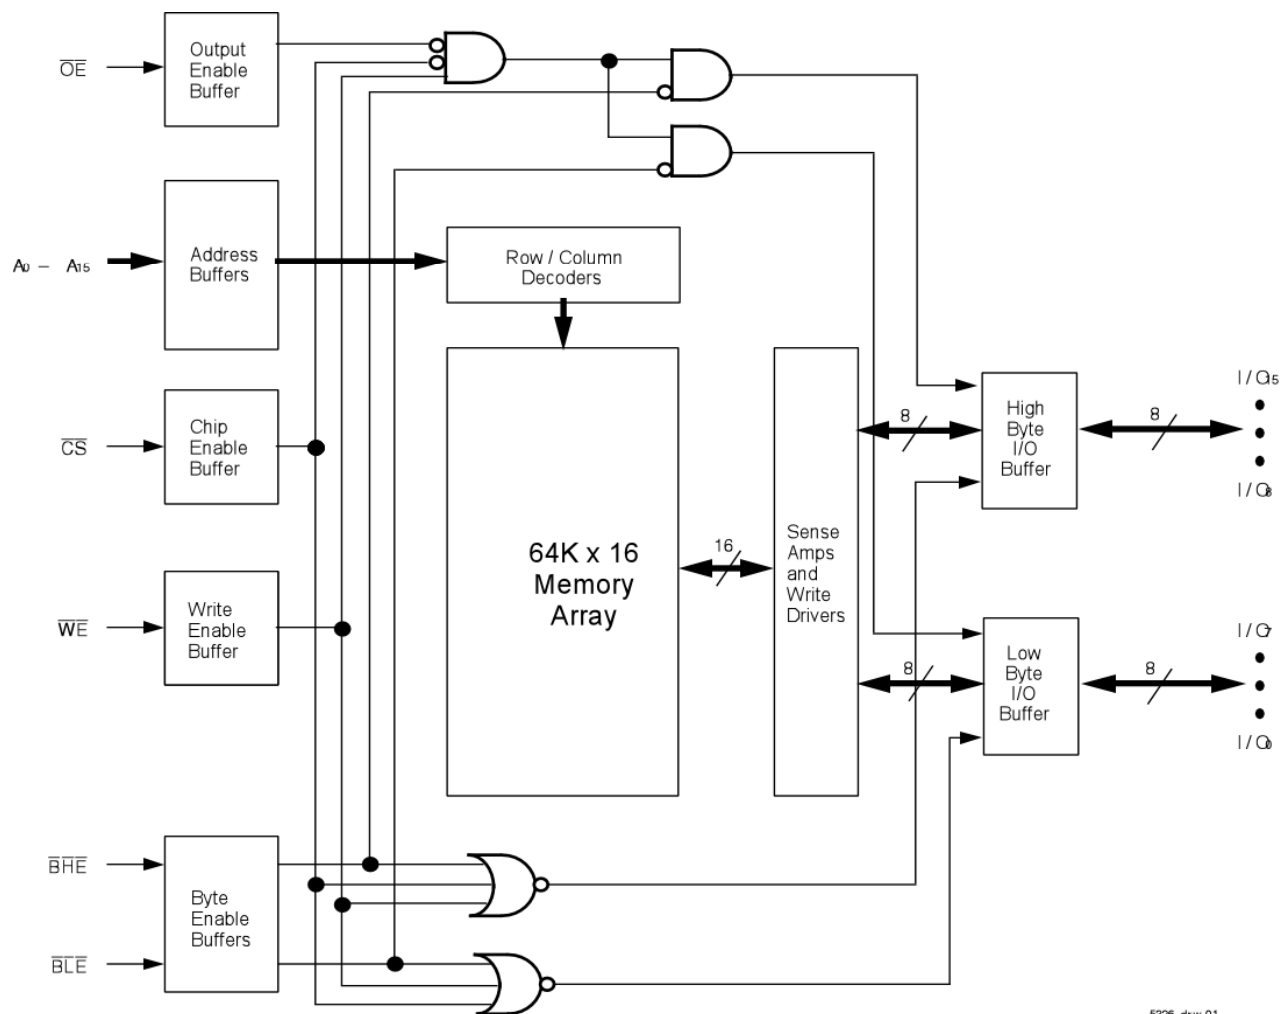

Description

The IDT71T016 is a 1,048,576-bit high-speed Static RAM organized as 64K x 16. It is fabricated using IDT's high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs.

The IDT71T016 has an output enable pin which operates as fast as 5ns, with address access times as fast as 10ns. All bidirectional inputs and outputs of the IDT71T016 are LVTTTL-compatible and operation is from a single 2.5V supply. Fully static asynchronous circuitry is used, requiring no clocks or refresh for operation.

The IDT71T016 is packaged in a JEDEC standard a 44-pin Plastic SOJ, 44-pin TSOP Type II, and a 48-ball plastic 7 x 7 mm FBGA.

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES:

5326 tbl 8

- All values are maximum guaranteed values.
- All inputs switch between 0.2V (Low) and V_{DD} - 0.2V (High).
- f_{MAX} = 1/t_{rc} (all address inputs are cycling at f_{MAX}); f = 0 means no address input lines are changing.
- Typical values are measured at 2.5V, 25°C and with equal read and write cycles. This parameter is guaranteed by device characterization but is not production tested.

Timing Waveform of Read Cycle No. 1^(1,2,3)

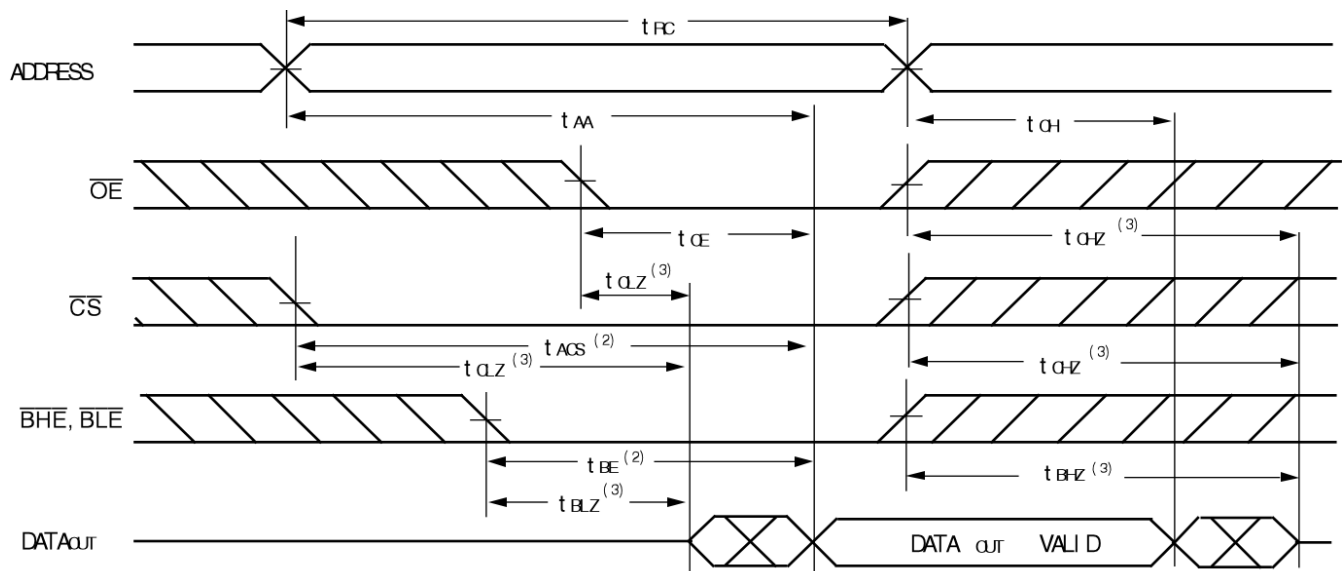

NOTES:

5326 dr w 06

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, \overline{CS} is LOW.
3. \overline{OE} , \overline{BHE} , and \overline{BLE} are LOW.

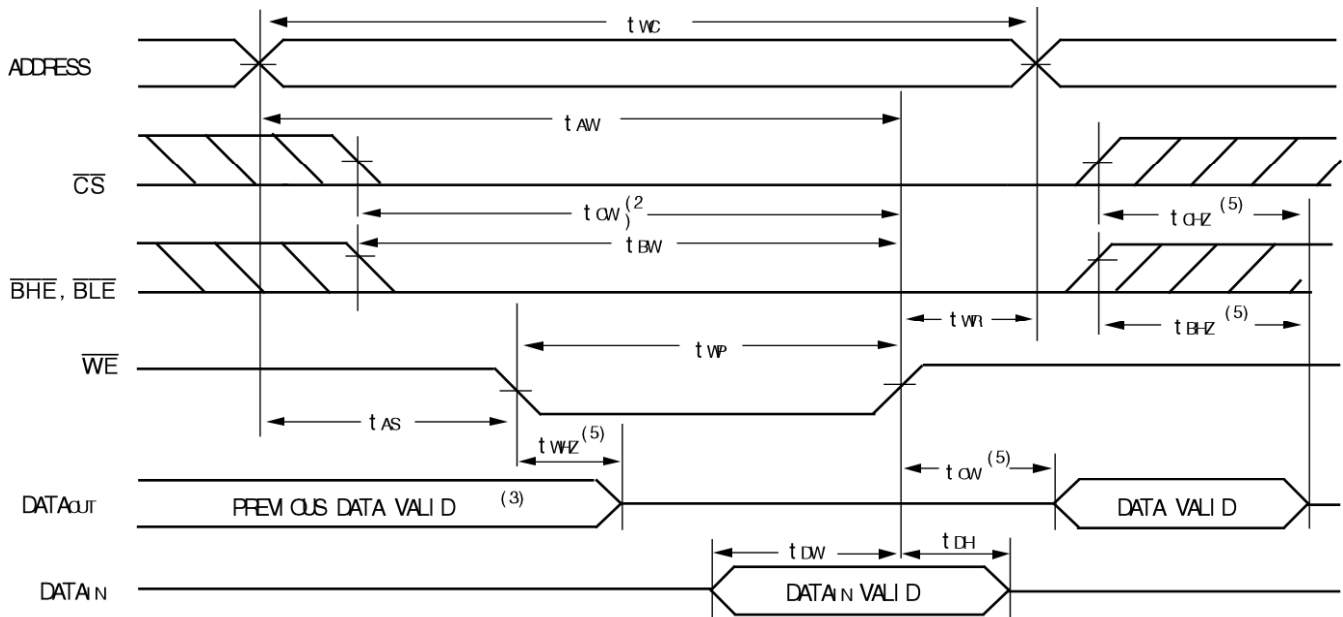

Timing Waveform of Read Cycle No. 2⁽¹⁾

5326 dr w 07

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Address must be valid prior to or coincident with the later of \overline{CS} , \overline{BHE} , or \overline{BLE} transition LOW; otherwise t_{AA} is the limiting parameter.
3. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 1 (**$\overline{\text{WE}}$** Controlled Timing)^(1,2,4)

5326 dr w 08

NOTES:

1. A write occurs during the overlap of a LOW $\overline{\text{CS}}$, LOW $\overline{\text{BHE}}$ or $\overline{\text{BLE}}$, and a LOW $\overline{\text{WE}}$.
2. $\overline{\text{OE}}$ is continuously HIGH. If during a $\overline{\text{WE}}$ controlled write cycle $\overline{\text{OE}}$ is LOW, t_{WP} must be greater than or equal to $t_{\text{WHZ}} + t_{\text{Dw}}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{Dw} . If $\overline{\text{OE}}$ is HIGH during a $\overline{\text{WE}}$ controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified t_{WP} .
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the $\overline{\text{CS}}$ LOW or $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ LOW transition occurs simultaneously with or after the $\overline{\text{WE}}$ LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 2 ($\overline{\text{CS}}$ Controlled Timing)^(1,4)

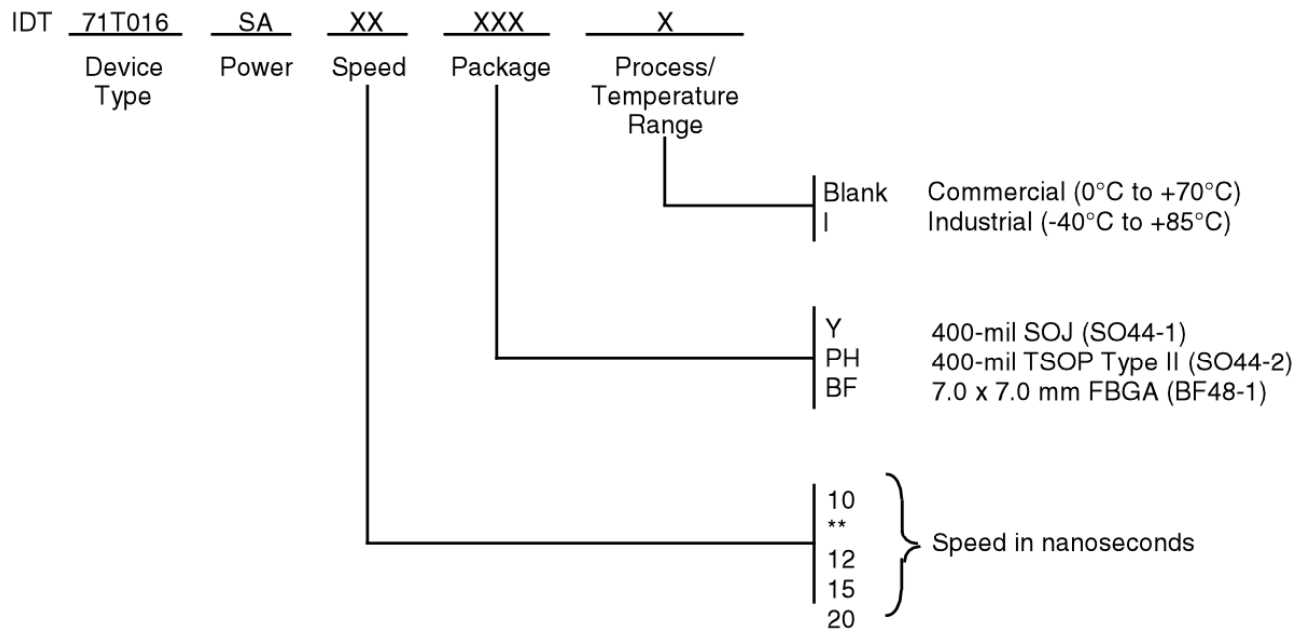

Timing Waveform of Write Cycle No. 3 ($\overline{\text{BHE}}$, $\overline{\text{BLE}}$ Controlled Timing)^(1,4)

NOTES:

1. A write occurs during the overlap of a LOW $\overline{\text{CS}}$, LOW $\overline{\text{BHE}}$ or $\overline{\text{BLE}}$, and a LOW $\overline{\text{WE}}$.
2. $\overline{\text{OE}}$ is continuously HIGH. If during a $\overline{\text{WE}}$ controlled write cycle $\overline{\text{OE}}$ is LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{DW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If $\overline{\text{OE}}$ is HIGH during a $\overline{\text{WE}}$ controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified t_{WP} .
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the $\overline{\text{CS}}$ LOW or $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ LOW transition occurs simultaneously with or after the $\overline{\text{WE}}$ LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured $\pm 200\text{mV}$ from steady state.
