General Description

The MX884 targets power management applications where high noise immunity and low cost are primary requirements. Its integrated 10-bit ADC provides high resolution, making it ideal for current monitoring systems. The MX884 enables digital power management, in which a microcontroller can readily monitor the current in a system and perform other control functions in power systems and motion control products.

The MX884 converts a small voltage developed across an external "current" sense resistor to a 10-bit digital output. It features a wide common mode input supply voltage range of 3V to 60V and easily interfaces to most microcontrollers. The design is simple yet cost-effective, requiring very few external components, making it especially suitable for high volume applications.

Absolute Maximum Ratings

T_A = +25°C unless otherwise noted, Voltages with respect to GND = 0V

Parameter	Symbol	Min	Max	Unit
IN Supply Voltage			70	V
LOAD			70	V
SCK, CS Input Voltage			6	V
SDO Open Drain Pull Up Voltage			6	V
Operating Temperature Range	T _A	-40	+85	°C
Storage Temperature Range	T _{STG}	-55	+150	°C

Absolute Maximum Ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this data sheet is not implied. Exposure of the device to the absolute maximum ratings for an extended period may degrade the device and affect its reliability.

Functional Description

The MX884 converts a small voltage developed across an external sense resistor (R_s) to a 10-bit digital output. Pin IN connects to the 3V to 60V power input. The external current sense resistor connects between pins IN and LOAD. The nominal A/D range is $100 \text{ mV } V(\text{IN}) - V(\text{LOAD})$ across R_s . The A/D least significant bit typically equals 0.1 mV across R_s . Inputs CS and SCK are TTL-level compatible, 5.5V maximum input voltage. Inputs can be driven from CMOS microcontrollers operating at supply voltages of 2.4 to 5.5V. Serial data output pin SDO is configured as open drain, maximum 5.5V external pull-up. SCK is used internally to clock the successive approximation register of the A/D.
