

HMIC™ Silicon PIN Diode Switches

V6

Features

- ◆ Broad Bandwidth
- ◆ Specified from 50MHz to 20GHz
- ◆ Usable from 50MHz to 26.5GHz
- ◆ Lower Insertion Loss / Higher Isolation than pHEMT
- ◆ Rugged
- ◆ Fully Monolithic,
- ◆ Glass Encapsulated Construction
- ◆ Up to +33dBm C.W. Power Handling
- ◆ RoHS Compliant

Description

The MASW-001100-1190, MASW-002100-1191 and MASW-003100-1192 are broadband monolithic switches using series and shunt connected silicon PIN diodes. They are designed for use as 2W, high performance switches in applications up to 26.5GHz. They provide performance levels superior to those realized by hybrid MIC designs incorporating beamlead and PIN chip diodes that require chip and wire assembly.

These switches are fabricated using M/A-COM's patented HMIC™ (Heterolithic Microwave Integrated Circuit) process, US Patent 5,268,310. This process allows the incorporation of silicon pedestals that form series and shunt diodes or vias by imbedding them in low loss, low dispersion glass. By using small spacing between elements, this combination of silicon and glass gives HMIC devices low loss and high isolation performance through low millimeter frequencies.

Large bond pads facilitate the use of low inductance ribbon leads, while gold backside metallization allows for manual or automatic chip bonding via 80/20, AuSn solder or conductive Ag epoxy.

Parameter	Absolute Maximum
Operating Temperature	-65°C to +125°C
Storage Temperature	-65°C to +150°C
Junction Temperature	+175°C
Applied Reverse Voltage	- 50V
RF C.W. Incident Power	+33dBm C.W.
Bias Current +25°C	±20mA

Max operating Conditions for a Combination of RF Power, D.C. Bias and Temperature:
+33dBm CW @ 15mA (per diode) @+85°C

Operation of the MASW Series Switches

Operation of the MASW series of PIN switches is achieved by simultaneous application of negative DC current to the low loss switching arm J1, J2, or J3, and positive DC current to the remaining switching arms as shown in the bias connection circuits. DC return is achieved via J1. The control currents should be supplied by constant current sources. The voltages at these points will not exceed ± 1.5 volts (1.2V typical) at currents up to ± 20 mA. In the low loss state, the series diode must be forward biased and the shunt diode reverse biased. In the isolated arm, the shunt diode is forward biased and the series diode is reverse biased.

Driver Connections MASW-001100-1190

Control Level (DC Current) at	Condition of RF Output
J2	J1-J2
-20mA	Low Loss
+20mA	Isolation

MASW-002100-1191

Control Level (DC Current) at	Condition of RF Output	Condition of RF Output
J2	J3	J1-J2
-20mA	+20mA	Low Loss
+20mA	-20mA	Isolation

MASW-003100-1192

Control Level (DC Current) at	Cond. of RF Output	Cond. of RF Output	Cond. of RF Output
J2	J3	J4	J1-J2
-20mA	+20mA	+20mA	Low Loss
+20mA	-20mA	+20mA	Isolation
+20mA	+20mA	-20mA	Low Loss

Handling Considerations

Cleanliness: These chips should be handled in a clean environment.

Electro-Static Sensitivity: The MASW series PIN switches are ESD, Class 1A sensitive (HBM). The proper ESD handling procedures should be used.

MASW-001100-1190 and Bias Connections¹

MASW-002100-1191 and Bias Connections¹

MASW-003100-1192 and Bias Connections¹

Notes:

1. RLC values are for an operation frequency of 2-18GHz and bias current of ± 20 mA per diode.

HMIC™ Silicon PIN Diode Switches

V6

Wire Bonding

Thermosonic wedge bonding using 0.003" x 0.00025" ribbon or 0.001" diameter gold wire is recommended. A stage temperature of 150°C and a force of 18 to 22 grams should be used. Ultrasonic energy, if necessary, should be adjusted to the minimum power required to achieve a good bond. RF wire and ribbon lengths should be kept as short as possible to minimize parasitic inductance.

Mounting

These chips have Ti-Pt-Au back metal and can be mounted using 80Au/20Sn eutectic solder or electrically conductive Ag epoxy. Mounting surface must be flat and clean of oils and contaminants.

Eutectic Die Attachment: An 80/20 gold-tin eutectic solder preform is recommended with a work surface temperature of 255°C and a tool tip temperature of 265°C. When hot gas is applied, the tool tip temperature should be 290°C. The chip should not be exposed to temperatures greater than 320°C for more than 20 seconds. No more than three seconds should be required for attachment. Solders containing tin should not be used.

Epoxy Die Attachment: A controlled thickness of no more than 2 mils is recommended for the best electrical and thermal conductivity. A thin epoxy fillet should be visible around the perimeter of the chip after placement to ensure complete coverage. Cure epoxy per manufacturer's recommended schedule. Typically +150°C for 1 hour.
