## Features

- Six Half-bridge Outputs Formed by Six High-side and Six Low-side Drivers
- Capable of Switching all Kinds of Loads (Such as DC Motors, Bulbs, Resistors, Capacitors and Inductors)
- R<sub>DSon</sub> Typically 1.0Ω at 25°C, Maximum 1.8Ω at 150°C
- Up to 650-mA Output Current
- Very Low Quiescent Current  $I_S < 20\mu A$  in Standby Mode
- Outputs Short-circuit Protected
- Overtemperature Prewarning and Protection
- Undervoltage Protection
- Various Diagnosis Functions Such as Shorted Output, Open Load, Overtemperature and Power Supply Fail
- Serial Data Interface
- Operation Voltage up to 40V
- Daisy Chaining Possible
- Serial Interface 5V Compatible, up to 2MHz Clock Frequency
- SO28 or QFN24 Power Package

## 1. Description

The Atmel<sup>®</sup> ATA6836 is a fully protected hex half-bridge driver designed in Smart Power SOI technology, used to control up to six different loads by a microcontroller in automotive and industrial applications.

Each of the six high-side and six low-side drivers is capable of driving currents up to 650mA. The drivers are internally connected to form six half-bridges and can be controlled separately from a standard serial data interface. Therefore, all kinds of loads, such as bulbs, resistors, capacitors and inductors, can be combined. The IC especially supports the application of H-bridges to drive DC motors.

Protection is guaranteed in terms of short-circuit conditions, overtemperature and undervoltage. Various diagnosis functions and a very low quiescent current in standby mode make a wide range of applications possible.

Automotive qualification referring to conducted interferences, EMC protection and ESD protection gives added value and enhanced quality for the exacting requirements of automotive applications.

Hex Half-bridge Driver with Serial Input Control

### Table 2-1.Pin Description SO28

Pin	Symbol	Function
1, 2	OUT5	Half-bridge output 5; formed by internally connected power MOS high-side switch 5 and low-side switch 5 with internal reverse diodes; short circuit protection; overtemperature protection; diagnosis for short and open load
3, 4	OUT4	Output 4; see pin 1
5	VS	Power supply output stages HS4, HS5, HS6, internal supply; external connection to pin 10 necessary
6, 7, 8, 9	GND	Ground; reference potential; internal connection to pins 20 to 23; cooling tab
10	VS	Power supply output stages HS1, HS2 and HS3
11, 12	OUT3	Output 3; see pin 1
13, 14	OUT2	Output 2; see pin 1
15, 16	OUT1	Output 1; see pin 1
17	INH	Inhibit input, 5V logic input with internal pull down, low = standby, high = normal operation
18	DO	Serial data output, 5V CMOS logic level tri-state output for output (status) register data, sends 16-bit status information to the microcontroller (LSB is transferred first). Output will remain tri-stated unless device is selected by CS = low; therefore, several ICs can operate on one data output line only
19	VCC	Logic supply voltage (5V)
20, 21, 22, 23	GND	Ground, see pins 6 to 9
24	CS	Chip select input, 5V CMOS logic level input with internal pull up; low = serial communication is enabled, high = disabled
25	CLK	Serial clock input, 5V CMOS logic level input with internal pull down, controls serial data input interface and internal shift register ( $f_{max} = 2MHz$ )
26	DI	Serial data input; 5V CMOS logic level input with internal pull down; receives serial data from the control device; DI expects a 16-bit control word with LSB being transferred first
27, 28	OUT6	Output 6; see pin 1

### 2.2 QFN24

Table 2-2.	Pin Description QFN24

Pin	Symbol	Function
1	OUT4 SENSE	Only for testability in final test
2	OUT4	Half-bridge output 4; formed by internally connected power MOS high-side switch 4 and low-side switch 4 with internal reverse diodes; short circuit protection; overtemperature protection; diagnosis for short and open load
3	VS	Power supply output stages HS4, HS5 and HS6
4	VS	Power supply output stages HS1, HS2 and HS3
5	OUT3	Output 3; see pin 1
6	OUT3 SENSE	Only for testability in final test
7	NC	Internal bond to GND
8	OUT2	Output 2; see pin 1
9	OUT2 SENSE	Only for testability in final test
10	OUT1 SENSE	Only for testability in final test
11	OUT1	Output 1; see pin 1
12	INH	Inhibit input; 5V logic input with internal pull down; low = standby, high = normal operation
13	DO	Serial data output; 5V CMOS logic level tri-state output for output (status) register data; sends 16-bit status information to the microcontroller (LSB is transferred first). Output will remain tri-stated unless device is selected by CS = low, therefore, several ICs can operate on one data output line only
14	VCC	Logic supply voltage (5V)
15	NC	Internal bond to GND
16	GND SENSE	Ground; reference potential; internal connection to the lead frame; cooling tab

### Table 2-2. Pin Description QFN24 (Continued)

Pin	Symbol	Function
17	CS	Chip select input; 5V CMOS logic level input with internal pull up; low = serial communication is enabled, high = disabled
18	CLK	Serial clock input; 5V CMOS logic level input with internal pull down; controls serial data input interface and internal shift register (f <sub>max</sub> = 2MHz)
19	DI	Serial data input; 5V CMOS logic level input with internal pull down; receives serial data from the control device; DI expects a 16-bit control word with LSB being transferred first
20	OUT6	Output 6; see pin 1
21	OUT6 SENSE	Only for testability in final test
22	OUT5 SENSE	Only for testability in final test
23	OUT5	Output 5; see pin 1
24	NC	Internal bond to GND

## 3. Functional Description

### 3.1 Serial Interface

Data transfer starts with the falling edge of the CS signal. Data must appear at DI synchronized to CLK and is accepted on the falling edge of the CLK signal. LSB (bit 0, SRR) has to be transferred first. Execution of new input data is enabled on the rising edge of the CS signal. When CS is high, pin DO is in a tri-state condition. This output is enabled on the falling edge of CS. Output data will change their state with the rising edge of CLK and stay stable until the next rising edge of CLK appears. LSB (bit 0, TP) is transferred first.

Table 3-1.Input Data Protocol

Bit	Input Register	Function
0	SRR	Status register reset (high = reset; the bits PSF, SCD and overtemperature shutdown in the output data register are set to low)
1	LS1	Controls output LS1 (high = switch output LS1 on)
2	HS1	Controls output HS1 (high = switch output HS1 on)
3	LS2	See LS1
4	HS2	See HS1
5	LS3	See LS1
6	HS3	See HS1
7	LS4	See LS1
8	HS4	See HS1
9	LS5	See LS1
10	HS5	See HS1
11	LS6	See LS1
12	HS6	See HS1
13	OLD	Open load detection (low = on)
14	SCT	Programmable time delay for short circuit (shutdown delay high/low = 12ms/1.5ms)
15	SI	Software inhibit; low = standby, high = normal operation (data transfer is not affected by standby function because the digital part is still powered)

Bit	Output (Status)	Function
	negistei	
0	TP	Iemperature prewarning: high = warning
		(overtemperature shutdown see remark below)
1	Status LS1	Normal operation: high = output is on, low = output is off Open-load detection: high = open load, low = no open load (correct load condition is detected if the corresponding output is
		switched off)
		Normal operation: high = output is on, low = output is off
2	Status HS1	(correct load condition is detected if the corresponding output is
		switched off)
3	Status LS2	Description see LS1
4	Status HS2	Description see HS1
5	Status LS3	Description see LS1
6	Status HS3	Description see HS1
7	Status LS4	Description see LS1
8	Status HS4	Description see HS1
9	Status LS5	Description see LS1
10	Status HS5	Description see HS1
11	Status LS6	Description see LS1
12	Status HS6	Description see HS1
13	SCD	Short circuit detected: set high, when at least one output is switched off by a short circuit condition
14	INH	Inhibit: this bit is controlled by software (bit SI in input register) and hardware inhibit (pin INH). High = standby, low = normal operation
15	PSF	Power supply fail: undervoltage at pin VS detected

|--|

Note: Bit 0 to 15 = high: overtemperature shutdown

 Table 3-3.
 Status of the Input Register After Power on Reset

Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Н	Н	Н	L	L	L	L	L	L	L	L	L	L	L	L	L

### 3.2 Power-supply Fail

In case of undervoltage at pin VS, an internal timer is started. When during a permanent undervoltage the delay time  $(t_{dUV})$  is reached, the power supply fail bit (PSF) in the output register is set and all outputs are disabled. When normal voltage is present again, the outputs are enabled immediately. The PSF bit remains high until it is reset by the SRR bit in the input register.

### 3.3 Open-load Detection

If the open-load detection bit (OLD) is set to low, a pull-up current for each high-side switch and a pull-down current for each low-side switch is turned on (open-load detection current  $I_{HS1-6}$ ,  $I_{LS1-6}$ ). If  $V_{VS} - V_{HS1-6}$  or  $V_{LS1-6}$  is lower than the open-load detection threshold (open-load condition), the corresponding bit of the output in the output register is set to high. Switching on an output stage with OLD bit set to low disables the open load function for this output.

### 3.4 Overtemperature Protection

If the junction temperature exceeds the thermal prewarning threshold,  $T_{jPW}$  set, the temperature prewarning bit (TP) in the output register is set. When the temperature falls below the thermal prewarning threshold,  $T_{jPW}$  reset, the bit TP is reset. The TP bit can be read without transferring a complete 16-bit data word: with CS = high to low, the state of TP appears at pin DO. After the microcontroller has read this information, CS is set high and the data transfer is interrupted without affecting the state of the input and output registers.

If the junction temperature exceeds the thermal shutdown threshold,  $T_{j \text{ switch off}}$ , the outputs are disabled and all bits in the output register are set high. The outputs can be enabled again when the temperature falls below the thermal shutdown threshold,  $T_{j \text{ switch on}}$ , and when a high has been written to the SRR bit in the input register. Thermal prewarning and shutdown threshold have hysteresis.

### 3.5 Short-circuit Protection

The output currents are limited by a current regulator. Current limitation takes place when the overcurrent limitation and shutdown threshold ( $I_{HS1-6}$ ,  $I_{LS1-6}$ ) are reached. Simultaneously, an internal timer is started. The shorted output is disabled when during a permanent short the delay time ( $t_{dSd}$ ) programmed by the short-circuit timer bit (SCT) is reached. Additionally, the short-circuit detection bit (SCD) is set. If the temperature prewarning bit TP in the output register is set during a short, the shorted output is disabled immediately and SCD bit is set. By writing a high to the SRR bit in the input register, the SCD bit is reset and the disabled outputs are enabled.

### 3.6 Inhibit

There are two ways to inhibit the Atmel<sup>®</sup> ATA6836:

- Set bit SI in the input register to 0
- Switch pin INH to 0V

In both cases, all output stages are turned off but the serial interface stays active. The output stages can be activated again by bit SI = 1 (when INH = VCC) or by pin INH switched back to VCC (when SI = 1).

## 4. Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. All values refer to GND pins.

Parameters	Pin SO28	Pin QFN24	Symbol	Value	Unit

5.21	Dead time between corresponding high- and low-side switches	$V_{VS} = 13V$ $R_{Load} = 30\Omega$			$t_{don} - t_{doff}$	1			μs	A
6	Inhibit Input	1	1			I		I	I	
6.1	Input voltage low-level threshold		17	12	V <sub>IL</sub>	$0.3  imes V_{VCC}$			V	Α
6.2	Input voltage high-level threshold		17	12	V <sub>IH</sub>			$0.7 \times V_{VCC}$	V	А
6.3	Hysteresis of input voltage		17	12	$\Delta V_{I}$	100		700	mV	А
6.4	Pull-down current	$V_{\rm INH} = V_{\rm VCC}$			I <sub>PD</sub>	10		80	μA	Α

\*) Type means: A = 100% tested, B = 100% correlation tested, C = Characterized on samples, D = Design parameter

Notes: 1. Delay time between rising edge of input signal at pin CS after data transmission and switch on/off output stages to 90% of final level. Device not in standby for t > 1ms.

## 7. Electrical Characteristics (Continued)

 $7.5V < V_S < 40V$ ;  $4.75 < V_{CC} < 5.25V$ ; INH = High;  $-40^{\circ}C < T_i < 150^{\circ}C$ ; unless otherwise specified, all values refer to GND pins.

No.	Parameters	Test Conditions	Pin SO28	Pin QFN24	Symbol	Min.	Тур.	Max.	Unit	Type*
7	Serial Interface: Logic	Inputs DI, CLK, CS								
7.1	Input voltage low-level threshold		24-26	17-19	V <sub>IL</sub>	$0.3 \times V_{VCC}$			V	A
7.2	Input voltage high-level threshold		24-26	17-19	V <sub>IH</sub>			$0.7 \times V_{VCC}$	V	A
7.3	Hysteresis of input voltage		24-26	17-19	$\Delta V_{I}$	50		500	mV	A
7.4	Pull-down current pin DI, CLK	$V_{DI}, V_{CLK} = V_{VCC}$	25, 26	18, 19	I <sub>PDSI</sub>	2		50	μA	A
7.5	Pull-up current pin CS	V <sub>CS</sub> = 0V	24	17	I <sub>PUSI</sub>	-50		-2	μA	А
8	Serial Interface: Logic	Output DO								
8.1	Output voltage low level	I <sub>OL</sub> = 3mA	18	13	V <sub>DOL</sub>			0.5	V	А
8.2	Output voltage high level	$I_{OL} = -1mA$	18	13	V <sub>DOH</sub>	V <sub>VCC</sub> - 0.7V			V	A
8.3	Leakage current (tri-state)	$V_{CS} = V_{VCC,}$ $0V < V_{DO} < V_{VCC}$	18	13	I <sub>DO</sub>	-10		10	μA	A

\*) Type means: A = 100% tested, B = 100% correlation tested, C = Characterized on samples, D = Design parameter

Notes: 1. Delay time between rising edge of input signal at pin CS after data transmission and switch on/off output stages to 90% of final level. Device not in standby for t > 1ms.

## 8. Serial Interface: Timing

Parameters	Test Conditions	Pin SO28	QFN24	Number in Timing Diagram (Figure 8-1 on page 15)	Symbol	Min.	Typ.	Max.	Unit
DO enable after CS falling edge	C <sub>DO</sub> = 100pF	18	13	1	t <sub>ENDO</sub>			200	ns
DO disable after CS rising edge	C <sub>DO</sub> = 100pF	18	13	2	t <sub>DISDO</sub>			200	ns
DO fall time	$C_{DO} = 100 pF$	18	13	-	t <sub>DOf</sub>			100	ns
DO rise time	$C_{DO} = 100 pF$	18	13	-	t <sub>DOr</sub>			100	ns
DO valid time	C <sub>DO</sub> = 100pF	18	13	10	t <sub>DOVal</sub>			200	ns
CS setup time		24	17	4	t <sub>CSSethl</sub>	225			ns
CS setup time		24	17	8	t <sub>CSSetlh</sub>	225			ns
CS high time	Input register bit 14 (SCT) = high	24	17	9	t <sub>CSh</sub>	17			ms
CS high time	Input register bit 14 (SCT) = low	24	17	9	t <sub>CSh</sub>	2.1			ms
CLK high time		25	18	5	t <sub>CLKh</sub>	225			ns
CLK low time		25	18	6	t <sub>CLKI</sub>	225			ns
CLK period time		25	18	-	t <sub>CLKp</sub>	500			ns
CLK setup time		25	18	7	t <sub>CLKSethl</sub>	225			ns
CLK setup time		25	18	3	t <sub>CLKSetlh</sub>	225			ns
DI setup time		26	19	11	t <sub>DIset</sub>	40			ns
DI hold time		26	19	12	t <sub>DIHold</sub>	40			ns

## Atmel ATA6836

Inputs DI, CLK, CS: High level =  $0.7 \times V_{CC}$ , low level =  $0.2 \times V_{CC}$ Output DO: High level =  $0.8 \times V_{CC}$ , low level =  $0.2 \times V_{CC}$ 

## 9. Noise and Surge Immunity

Parameters	Test Conditions	Value
Conducted interferences	ISO 7637-1	Level 4 <sup>(1)</sup>
Interference suppression	VDE 0879 Part 2	Level 5
ESD (Human Body Model)	ESD S 5.1	4kV
CDM (Charge Device Model)	ESD STM5.3	750V for corner pins (SO package only) 500V all other pins
MM (Machine Model)	ESD STM5.2	200V

Note: 1. Test pulse 5:  $V_{vbmax} = 40V$ 

## **10. Application Circuit**

Figure 10-1. Application Circuit

### 10.1 Application Notes

- Connect the blocking capacitors at  $V_{CC}$  and  $V_{S}$  as close as possible to the power supply and GND pins.
- Recommended value for capacitors at V<sub>S</sub>: Electrolytic capacitor C >  $22\mu$ F in parallel with a ceramic capacitor C = 100nF. Value for electrolytic capacitor depends on external loads, conducted interferences and reverse-conducting current IHSX (see Section 4. "Absolute Maximum Ratings" on page 10).
- Recommended value for capacitors at VCC: Electrolytic capacitor C > 10µF in parallel with a ceramic capacitor C = 100nF.
- To reduce thermal resistance, place cooling areas on the PCB as close as possible to GND pins and to the die paddle in QFN24.
- Only for the QFN24 versions: The sense pins OUTx SENSE can either be left open or can be connected to the adjacent OUTx pin. Never use the sense pins OUTx SENSE as power outputs.

## 11. Ordering Information

Extended Type Number	Package	Remarks
ATA6836-TIQY	SO28	Taped and reeled, Pb-free
ATA6836C-TIQY	SO28	Taped and reeled, Pb-free
ATA6836-PXQW	QFN24	Taped and reeled, Pb-free
ATA6836C-PXQW	QFN24	Taped and reeled, Pb-free

## 12. Package Information

### 12.1 SO28

# Atmel ATA6836

### 12.2 QFN24

Package: QFN 24 - 5 x 5 Exposed pad 3.6 x 3.6 (acc. JEDEC OUTLINE No. MO-220) Dimensions in mm

Not indicated tolerances ±0.05

## 13. Revision History

Please note that the following page numbers referred to in this section refer to the specific revision mentioned, not to this document.

Revision No.	History	
4952J-AUTO-03/11	Section 10.1 "Application Notes" on page 17 changed	
	Table 2-1 "Pin Description SO28" on page 4 changed	
49521-AUTO-08/TU	Ordering Information page 19 changed	
4952H-AUTO-02/10 • Section 7 "Electrical Characteristics" numbers 5.10 and 5.11 changed		
4952G-AUTO-12/09	Section 7 "Electrical Characteristics" number 1.2 on page 11 changed	
	Put datasheet in a new template	
4952F-AUTO-07/09	Section 4 "Absolute Maximum Ratings" on pag 10 changed	
	Section 7 "Electrical Charcteristics" number 1.7 on page 11 added	
	Features on page 1 changed	
	Table 2-1 "Pin Description SO28" on page 4 changed	
	Table 2-2 "Pin Description QFN24" on pages 5 to 6 changed	
4052E_AUTO_10/08	Section 4 "Absolute Maximum Ratings" on page 10 changed	
49022-7010-10/00	<ul> <li>Section 6 "Operating Range" on page 10 changed</li> </ul>	
	Section 7 "Electrical Characteristics" on pages 11 to 13 changed	
	Section 8 "Serial Interface: Timing" on page 14 changed	
	Section 9 "Noise and Surge Immunity" on page 16 changed	
4952D-AUTO-10/07	Section 11 "Ordering Information" on page 18 changed	
4952C-AUTO-09/07	Section 7 "Electrical Characteristics" numbers 5.15 and 5.16 on page 12 changed	
	Section 9 "Noise and Surge Immunity" on page 16 changed	
	Put datasheet in a new template	
4952B-AUTO-07/07	<ul> <li>Section 7 "Electrical Characteristics" numbers 1.5, 3.1, 5.15 and 8.2 on pages 11 to 13 changed</li> </ul>
