
Features

- Reference Oscillator up to 15 MHz
- Two Programmable 16-bit Dividers Adjustable from 2 to 65535
- Fine Tuning Steps
 - AM ≥ 1 kHz
 - FM ≥ 2 kHz
- Four Programmable Switching Outputs (Open Drain up to 15V)
- Integrated Loop-push-pull Stage for AM/FM
- High Signal/Noise Ratio

AM/FM PLL with 4 Switches

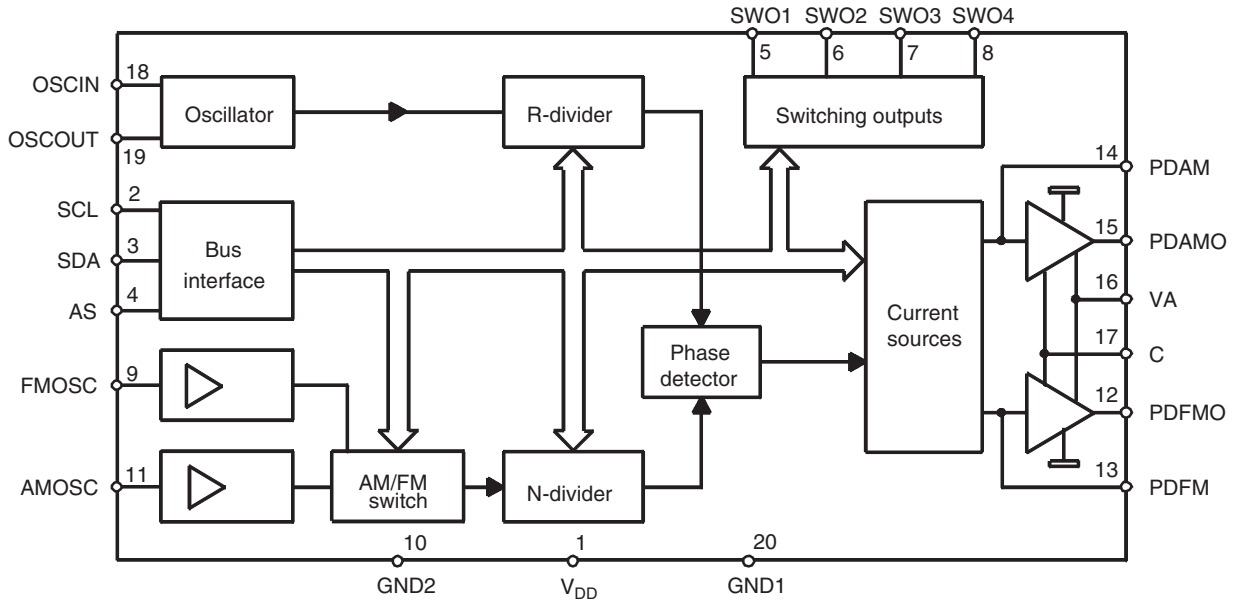

ATR4285

1. Description

The ATR4285 is an integrated circuit in BiCMOS technology for frequency synthesizers. It performs all the functions of a PLL radio tuning system and is controlled by a 2-wire bus. The device is designed for all frequency synthesizer applications in radio receivers, as well as for RDS (Radio Data System) applications.

Pin	Symbol	Function
1	VDD	Supply voltage
2	SCL	Bus clock
3	SDA	Bus data
4	AS	Address selection
5	SWO1	Switching output 1
6	SWO2	Switching output 2
7	SWO3	Switching output 3
8	SWO4	Switching output 4
9	FMOSC	FM oscillator input
10	GND2	Ground 2 (analog)
11	AMOSC	AM oscillator input
12	PDFMO	FM analog output
13	PDFM	FM current output
14	PDAM	AM current output
15	PDAMO	AM analog output
16	VA	Analog supply voltage
17	C	Capacitor
18	OSCIN	Oscillator input
19	OSCOUT	Oscillator output
20	GND1	Ground 1 (digital)

3. Functional Description

The ATR4285 is controlled via the 2-wire bus. One module-address byte, two subaddress bytes, and five data bytes enable programming.

The module address contains a programmable address bit A1, which (along with address select input AS, pin 4) enables the operation of two ATR4285 devices in one system. If bit A1 is identical with the status of the address select input AS, the chip is selected.

The subaddress determines which of the data bytes is transmitted first. If the subaddress of the R-divider is transmitted, the sequence of the next data bytes is DB 0 (status), DB 1 and DB 2. If the subaddress of the N-divider is transmitted, the sequence of the next data bytes is DB 3 and DB 4. The bit organization of the module address, subaddress and data bytes is shown in Table [“Bit Organization” on page 9](#).

Each transmission on the bus begins with the "START" condition and must be ended by the "STOP" condition (see Table [“Transmission Protocol” on page 9](#)).

The integrated circuit ATR4285 has two separate inputs for the AM and FM oscillators. Pre-amplified AM and FM signals are fed to the 16-bit N-divider via the AM/FM switch. The AM/FM switch is software controlled. Tuning steps can be selected by the 16-bit R-divider.

Furthermore, the device provides a digital memory phase detector and two separate current sources for AM and FM amplifiers (charge pump) as given in the Table [“Electrical Characteristics” on page 5](#). The separate current sources (charge pumps) allow independent gain adjustment, providing high current for high-speed tuning and low current for stable tuning.

4. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

9.1 Recommendations for Applications

- $C_3 = 100\text{ nF}$ should be very close to pin 1 (V_{DD}) and pin 20 (GND 1)
- GND 2 (pin 10 — analog ground) and GND 1 (pin 20 — digital ground) must be connected according to [Figure 9-1](#)
- 4 MHz crystal must be very close to pin 18 and pin 19
- Components of the charge pump (C_1/R_1 for AM and C_2/R_2 for FM) should be very close to pin 14 with respect to pin 13
