

Features

- Two Alignment-free PLL FM Demodulators, Automatic Lock-in on the Received Sound Carrier Frequency
- Mono and Dual Channel Application
- Sound IF Inputs Provided for Ceramic Filters
- Automatic Mute for Second Sound Channel (Squelch)
- Mute Function for Both Sound Channels
- 5-V Supply Voltage, Low-power Consumption
- Few External Components
- Pb-free Package, which is Compliant with Requirements of RoHS

Dual-channel FM Sound Demodulator for TV Systems

1. Description

The U2860B-M is a dual-channel FM sound demodulator realized with Atmel's advanced bipolar process. All TV FM standards, from 4.5 MHz up to 6.5 MHz (standard M, B/G, I, D/K) can be processed with high performance. The circuit is alignment-free and has a minimum number of external components. With 5V supply voltage, the U2860B-M is suitable for TV, VCR and multimedia applications.

Table 2-1. Pin Description

Pin	Symbol	Function
1	VIN1	Intercarrier input of sound channel 1 (5.5 MHz)
2	NC	Not connected
3	VMUTE	Mute for sound channel 1 + 2 "on/off"
4	VSQUE	Automatic mute for 2nd sound channel (squelch) "on/off"
5	NC	Not connected
6	VAF2	Audio output AF2 of sound channel 2
7	VAF1	Audio output AF1 of sound channel 1
8	C8	Decoupling capacitor for sound channel 1
9	C9	Decoupling capacitor for sound channel 2
10	RREF	VCO offset of the free-running frequency
11	CSTAB	Internal supply voltage stabilization
12	GND	Ground
13	VS	Supply voltage
14	VIN2	Intercarrier input of sound channel 2 (5.74 MHz)

3. Circuit Description

The U2860B-M includes two identical sound IF channels. Each consists of a limiter amplifier, PLL FM demodulator and AF amplifier. Additionally, this circuit contains a squelch function, mute switch and internal voltage regulation.

4. Limiter Amplifiers

The intercarrier signals are fed through external ceramic bandpass filters to a 7-stage limiter amplifier. This guarantees high input sensitivity and excellent AM suppression.

5. PLL FM Demodulators

The alignment-free Phase Locked Loop (PLL) demodulator covers a wide frequency range of 4.5 MHz up to 6.5 MHz with low-noise performance. The linear voltage to frequency characteristic results in low harmonic distortion. The free-running frequency of the internal VCO circuit is about 5.5 MHz. For this frequency, the input sensitivity and VCO locking is optimal. An additional external resistor at pin 10 allows a frequency shift of ± 1 MHz via an internal offset current. With this option, it is possible to shift the optimum conditions to the upper frequency (6.5 MHz) or to the lower frequency (4.5 MHz). The offset current acts simultaneously on both VCO circuits. If no resistor is connected, the offset current is disabled.

6. Audio Amplifiers

The demodulated signals are amplified to 500 mVrms with low output impedance at the audio outputs (pin 6 and pin 7). AC decoupling at pin 8 and pin 9 of the audio amplifiers leads to high common mode rejection.

7. Squelch Function

For channel 2 the audio output amplifier and VCO2 is muted automatically (squelch) when the second sound carrier is not present. This avoids a wrong identification for stereo and dual sound in the stereo decoder. Therefore, with mono sound, there is no output signal at pin 6. The automatic squelch function can be disabled by switching pin 4 to ground.

8. Mute Switch

Simultaneous muting of both circuits is possible by switching pin 3 to ground.

9. Internal Voltage Stabilizer

The internal bandgap reference ensures constant performance independent of supply voltage and temperature.

10. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
