

## Features

- Adjustable DC Characteristic
- Transmit and Receive Gain Adjustable
- Symmetrical Input of Microphone Amplifier
- Anti-clipping in Transmit Direction
- Automatic Line-loss Compensation
- Built-in Ear Protection
- DTMF and MUTE Input
- Adjustable Sidetone Suppression Independent of Sending and Receiving Amplification
- Integrated Amplifier for Open-listening Operation
- Anti-clipping for Loudspeaker Amplifier
- Improved Acoustical Feedback Suppression
- Selectable Line Impedance
- Voice Switch
- Supply Voltages for All Functional Blocks of a Subscriber Set
- Operation Possible from 10-mA Line Current
- Filters Against EMI on Critical I/O

## Benefits

- Complete System Integration of Analog Signal Processing on One Chip
- Very Few External Components
- Less Components for EMI protection

## Applications

- Feature Phones
- Answering Machines
- Fax Machines
- Speaker Phones

## 1. Description

The Atmel® telephone circuit U4089B-P is a linear integrated circuit for use in feature phones, answering machines and fax machines. It contains the speech circuit, sidetone equivalent and ear protection rectifiers. The circuit is line-powered and contains all components necessary for the amplification of signals and adaptation to the line.

An integrated voice switch with loudspeaker amplifier enables open-listening or hands-free operation. With an anti-feedback function, acoustical feedback during open listening can be reduced significantly. The generated supply voltage is suitable for a wide range of peripheral circuits.

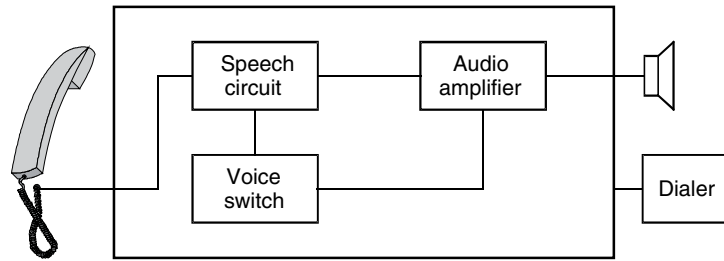

## Monolithic Integrated Feature Phone Circuit

**Figure 1-1.** Simple Block Diagram

**Figure 1-2.** Block Diagram

## 2. Pin Configuration

Figure 2-1. Pinning SSO44

Table 2-1. Pin Description

Pin	Symbol	Function
1	DTMF	Input for DTMF signals. Also used for the answering machine and hands-free input.
3	MIC 2	Non-inverting input of microphone amplifier.
4	MIC 1	Inverting input of microphone amplifier.
6	IND	The internal equivalent inductance of the circuit is proportional to the value of the capacitor at this pin. A resistor connected to ground may be used to reduce the DC line voltage.
7	V <sub>L</sub>	Line voltage.
8	GND	Reference point for DC and AC output signals.
9	SENSE	A small resistor (fixed) connected from this pin to V <sub>L</sub> sets the slope of the DC characteristic, and affects the line-length equalization characteristics, and the line current at which the loudspeaker amplifier is switched on.
10	V <sub>B</sub>	Unregulated supply voltage for peripheral circuits (voice switch); limited to typically 7V.
11	SAO	Output of loudspeaker amplifier.
13	V <sub>MP</sub>	Regulated supply voltage 3.3V for peripheral circuits. The maximum output current is 2mA.
20	IMPSEL	Control input for selection of line impedance 1) 600Ω 2) 900Ω 3) Mute of second transmit stage (TXA); also used for indication of external supply (answering machine); last chosen impedance is stored.
21	TSACL	Time constant of anti-clipping of speaker amplifier.
22	GSA	Current input for setting the gain of the speaker amplifier. Adjustment characteristic is logarithmical. For RGSA > 2MΩ, the speaker amplifier is switched off.
23	SAI	Speaker amplifier input (for loudspeaker, tone ringer and hands-free use).

Note: Filters against electromagnetic interference (EMI) are located at pins MIC1, MIC2, RECIN and STI.

**Table 2-1.** Pin Description (Continued)

Pin	Symbol	Function
24	MUTX	Three-state input of transmit mute: 1) Speech condition; inputs MIC1/MIC2 active. 2) DTMF condition; input DTMF active. A part of the input signal is passed to the receiving amplifier as a confidence signal during dialing. 3) Input DTMF used for answering machine and hands-free use; receive branch is not affected.
25	ATAFS	Attenuation of acoustical feedback suppression. Maximum attenuation of AFS circuit is set by a resistor at this pin. Without the resistor, AFS is switched off.
26	INLDT	Input of transmit level detector.
27	INLDR	Input of receive level detector.
28	TLDT	Time constant of transmit level detector.
29	TLDR	Time constant of receive level detector.
30	AGA	Automatic gain adjustment with line current. A resistor connected from this pin to GND sets the starting point. Maximum gain change is 6 dB.
31	IREF	Internal reference current generation; $R_{REF} = 62k\Omega$ ; $I_{REF} = 20\mu A$
32	STO	Side-tone reduction output. Output resistance is approximately $300\Omega$ . Maximum load impedance is $10k\Omega$ .
33	$V_M$	Reference node for microphone-earphone and loudspeaker amplifier. Supply for electret microphone ( $I_M \geq 300mA$ ).
36	STI	Input for side-tone network.
39	RECO	Output of receiving amplifier.
40	$G_R$	A resistor connected from this pin to GND sets the receiving amplification of the circuit; amplifier RA1 can be muted by applying $V_{MP}$ to $G_R$ .
41	TTXA	Time constant of anti-clipping in transmit path.
42	RECI	Input of receiving path; input impedance is typically $80k\Omega$ .
44	$G_T$	A resistor from this pin to GND sets the amplification of microphone and DTMF signals; the input amplifier can be muted by applying $V_{MP}$ to $G_T$ .

Note: Filters against electromagnetic interference (EMI) are located at pins MIC1, MIC2, RECI and STI.

### 3. DC Line Interface and Supply-voltage Generation

The DC line interface consists of an electronic inductance and an output stage which charges the capacitor at  $V_B$ . The value of the equivalent inductance is given by:

$$L = R_{\text{SENSE}} \times C_{\text{IND}} \times (R_{\text{DC}} \times R_{30}) / (R_{\text{DC}} + R_{30})$$

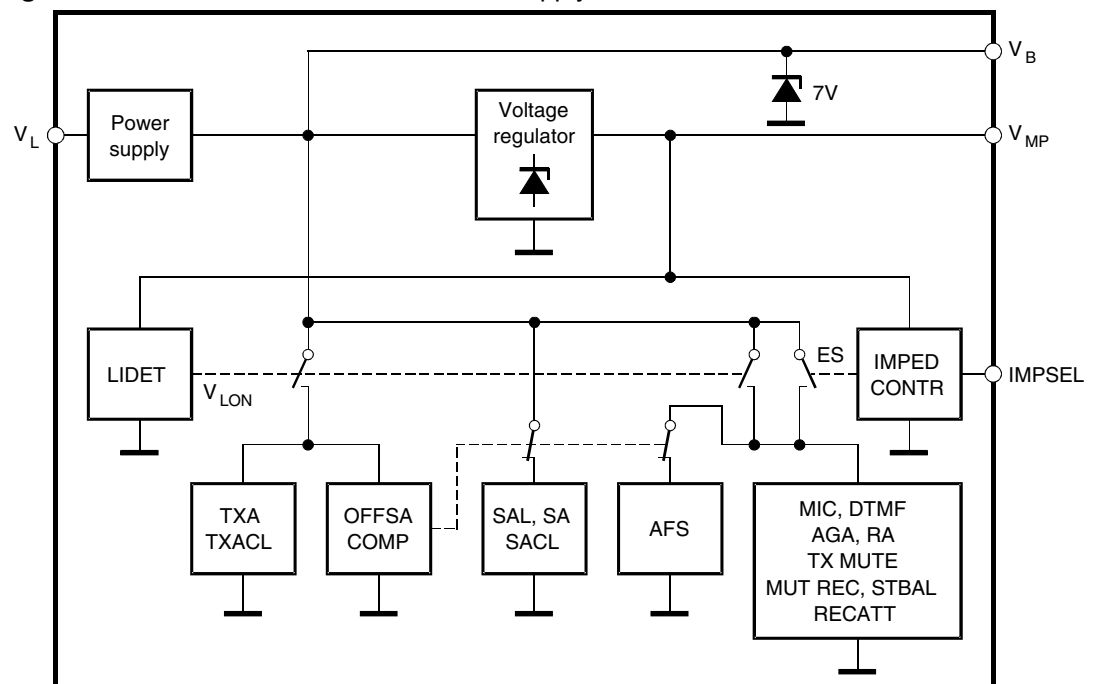

In order to improve the supply during worst-case operating conditions, the PNP current source ( $I_{\text{BOPT}}$ ) supplies an extra amount of current to the supply voltages when the NPN in parallel is unable to conduct current.

The Atmel® U4089B-P contains a series regulator which provides a supply voltage  $V_{\text{MP}}$  of 3.3V at 2mA suitable for a microprocessor.

**Figure 3-1.** DC Line Interface With Electronic Inductance and Generation of Regulated and Unregulated Supply

**Figure 3-2.** Functional Blocks for Power Supply

1. In speech condition, the system is supplied by the line current. If the LIDET block detects a line voltage above the fixed threshold (1.9V), the internal signal VLON is activated, thus switching on all blocks of the chip.

For line voltages below 1.9V, the switches remain in their quiescent state as shown in [Figure 3-2](#).

OFFSACOMP disables the group listening feature (SAI, SA, SACL, AFS) below line currents of approximately 10 mA.

2. Selecting IMPSEL = high impedance activates all switches on the ES line.

## 4. Acoustic Feedback Suppression

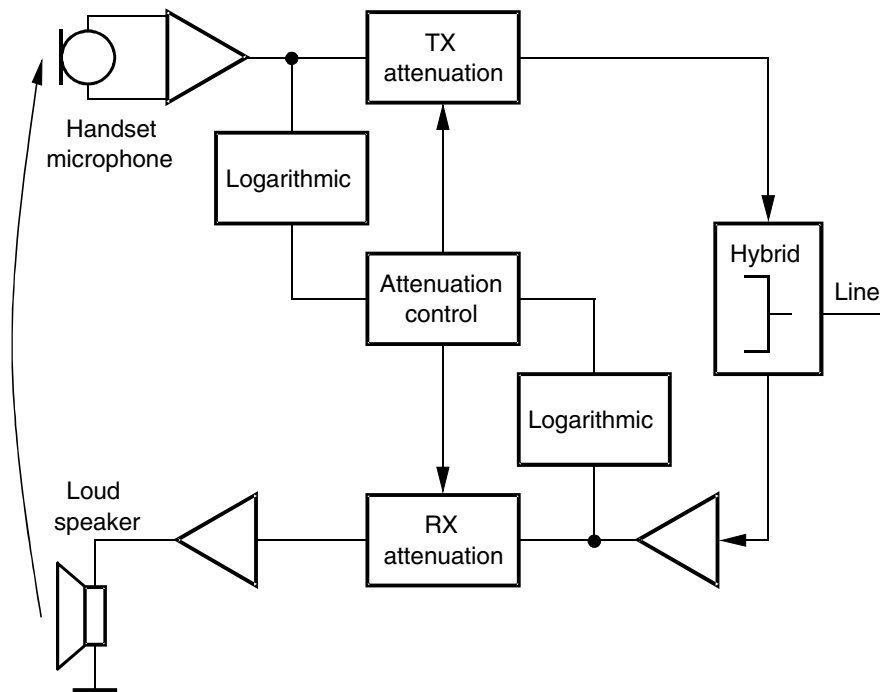

Acoustical feedback from the loudspeaker to the handset microphone may cause instability in the system. The Atmel® U4089B-P offers a very efficient feedback suppression circuit which uses a modified voice switch topology. [Figure 4-1](#) shows the basic system configuration.

Two attenuators (TX ATT and RX ATT) reduce the critical loop gain by introducing an externally adjustable amount of loss either in the transmit or in the receive path. The sliding control in block ATT CONTR determines whether the TX or the RX signal has to be attenuated. The overall loop gain remains constant under all operating conditions.

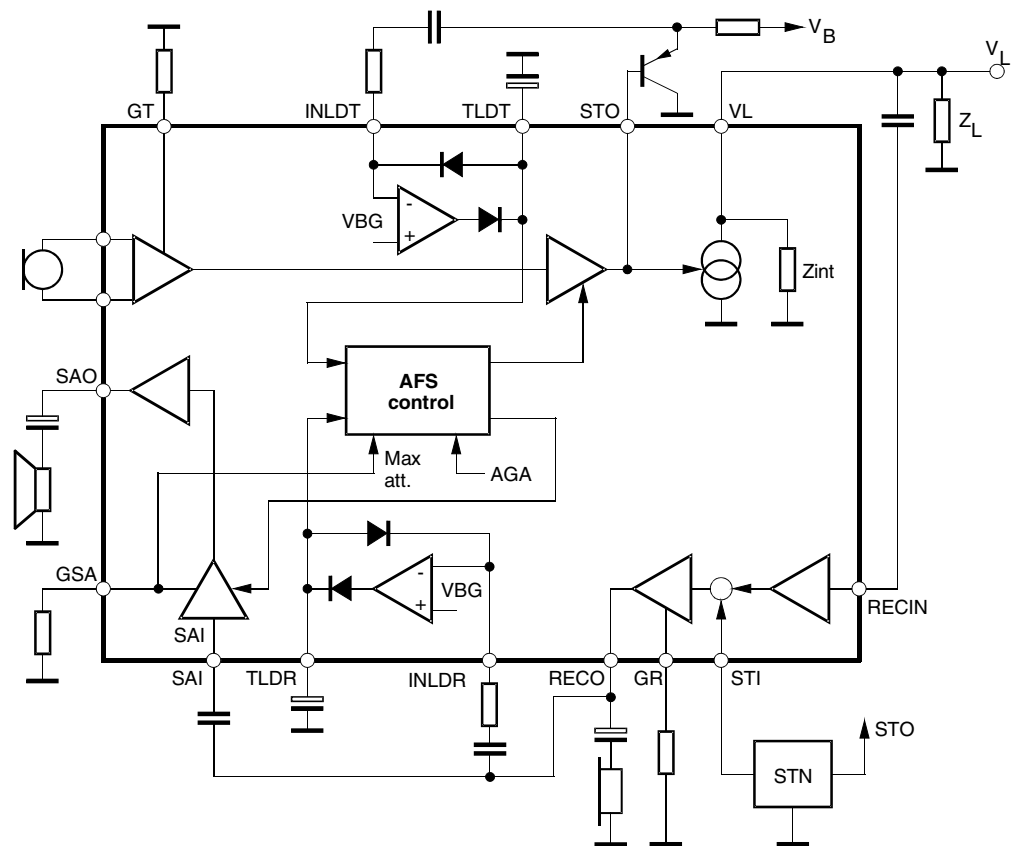

Selection of the active channel is made by comparison of the logarithmically compressed TX and RX envelope curves.

The system configuration for group listening, which is realized in the Atmel U4089B-P, is illustrated in [Figure 4-2](#). TXA and SAI represent the two attenuators; the logarithmic envelope detectors are shown in a simplified way (operational amplifiers with two diodes).

**Figure 4-1.** Basic Voice-switch System

**Figure 4-2.** Integration of the Acoustic Feedback-suppression Circuit Into the Speech Circuit Environment

**Figure 4-3.** Acoustic Feedback Suppression by Alternative Control of Transmit and Speaker Amplifier Gain

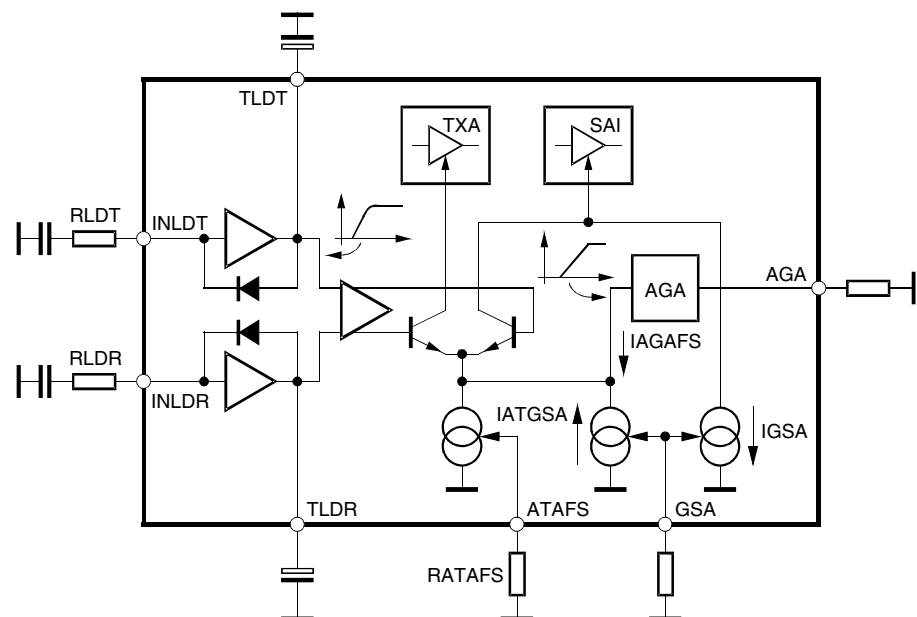

Figure 4-3 on page 7 provides a detailed diagram of the AFS (Acoustic Feedback Suppression). Receive and transmit signals are first processed by logarithmic rectifiers in order to produce the speech envelopes at TLDT and RLDT. After amplification, a decision is made by the differential pair which direction should be transmitted.

The attenuation of the controlled amplifiers TXA and SAI is determined by the emitter current  $I_{AT}$  which is comprised of three parts:

$I_{ATAFS}$	sets maximum attenuation
$I_{ATGSA}$	decreases the attenuation when speaker amplifier gain is reduced
$I_{AGAFS}$	decreases the attenuation according to the loop-gain reduction caused by the AGA function

$$I_{AT} = I_{ATAFS} - I_{ATGSA} - I_{AGAFS}$$

$$\Delta G = I_{AT} \times 0.67 \text{ dB}/\mu\text{A}$$

Figure 4-4 illustrates the principal relationship between speaker amplifier gain (GSA) and attenuation of AFS (ATAFS). Both parameters can be adjusted independently, but the internal coupling between them has to be considered. The maximum GSA value to be used is 36 dB. The shape of the characteristic is moved in the x-direction by adjusting resistor  $R_{ATAFS}$ , thus changing  $ATAFS_m$ . The actual value of the attenuation ( $ATAFS_a$ ), however, can be determined by reading the value which belongs to the actual gain  $GSA_a$ . If the speaker amplifier gain is reduced, the attenuation of AFS is automatically reduced by the same amount in order to achieve a constant loop gain. Zero attenuation is set for speaker gains  $GSA \geq GSA_0 = 36\text{dB} - ATAFS_m$ .

**Figure 4-4.** Reducing Speaker Amplifier Gain Results in an Equal Reduction of AFS Attenuation

## 5. Operating Range of Speaker Amplifier

The basic behavior is illustrated in Figure 5-1. Actual values of  $IL_{ON}/IL_{OFF}$  vary slightly with the adjustment of the DC characteristics and the selection of the internal line impedance.

**Figure 5-1.** Threshold of Speaker Amplifier

**Figure 5-2.** Comparator Thresholds Depend on DC Mask and Line Impedance

## 6. Absolute Maximum Ratings

Parameters	Symbol	Value	Unit
Line current	$I_L$	140	mA
DC line voltage	$V_L$	12	V
Junction temperature	$T_j$	125	°C
Ambient temperature	$T_{amb}$	-25 to +75	°C
Storage temperature	$T_{stg}$	-55 to +150	°C
Total power dissipation, $T_{amb} = 60^\circ\text{C}$ , SSO44	$P_{tot}$	0.9	W
ESD (Human Body Model), ESD S 5.1 Standard	$V_{ESD}$	1.5	kV
ESD (Machine Model), JEDEC A115A	$V_{ESD}$	150	V

## 7. Thermal Resistance

Parameters	Symbol	Value	Unit
Junction ambient	$R_{thJA}$	70	K/W

## 8. Electrical Characteristics

$f = 1\text{kHz}$ ,  $0\text{dBm} = 775\text{mV}_{\text{rms}}$ ,  $I_M = 0.3\text{mA}$ ,  $I_{MP} = 2\text{mA}$ ,  $RDC = 130\text{k}\Omega$ ,  $T_{amb} = 25^\circ\text{C}$ ,  $RGSA = 560\text{k}\Omega$ ,  $Z_{ear} = 68\text{nF} + 100\Omega$ ,  $Z_M = 68\text{nF}$ , Pin 30 open (AGA),  $V_{MUTX} = \text{GND}$ , see [Figure 8-11 on page 22](#) (AC tests), unless otherwise specified.

Parameters	Test Conditions	Pin	Symbol	Min.	Typ.	Max.	Unit
