## Features

- Temperature and Voltage Compensated Frequency
- Warning Indication of Lamp Failure by Means of Frequency Doubling can be Disabled
- Voltage Dependence of the Car Indicator Lamps Compensated for Lamp Failure
- Relay Output with High Current Carrying Capacity and Low Saturation Voltage
- Minimum Lamp Load for Flasher Operation $\geq$ 1W
- Load-dump Protection
- Very Low Susceptibility to EMI
- Protection According to ISO/TR 7637/1 Level 4

## 1. Description

The design of the U6433B is similar to that of U6043B, both devices have the same excellent EMC (Electro Magnetic Capability) and protection features. The U6433B includes an additional $8-\mathrm{mV}$ comparator and a logical connection with the frequency doubling stage. This combination can be used for a hazard switch which bypasses the external shunt resistor to disable the frequency doubling. This feature is especially important with respect to the US automotive industry. During direction mode the U6433B works like other flashers, that is, frequency doubling in the case of lamp outage.

## 3. Functional Description

### 3.1 Pin 1, GND

The integrated circuit is protected against damage via resistor $R_{4}$ to ground ( -31 ) in the case of battery reversal.

An integrated protection circuit together with external resistances $R_{2}$ and $R_{4}$ limits the current pulses in the IC.

### 3.2 Pin 2, Supply Voltage, $\mathbf{V}_{\mathbf{S}}$ - Power

The arrangement of the supply connections to pin 2 must be so as to ensure that, on the connection printed circuit board (PCB), the resistance of $\mathrm{V}_{\mathrm{S}}$ to pin 6 is lower than that to pin 2.

### 3.3 Pin 3, Relay Control Output (Driver)

The relay control output is a high-side driver with a low saturation voltage and is capable of driving a typical automotive relay with a minimum coil resistance of $60 \Omega$

### 3.4 Pins 4 and 5, Oscillator

The flashing frequency, $f_{1}$, is determined by the $R_{1} C_{1}$ components as follows (see Figure 1-1 on page 2):
$\mathrm{f}_{1} \approx \frac{1}{\mathrm{R}_{1} \times \mathrm{C}_{1} \times 1.5} \mathrm{~Hz}$
where
$\mathrm{C}_{1} \leq 47 \mu \mathrm{~F}$
$\mathrm{R}_{1}+6.8 \mathrm{k} \Omega$ to $510 \mathrm{k} \Omega$
In the case of a lamp outage (see pin 7) the oscillator frequency is switched to the lamp outage frequency $f_{2}$ with $f_{2} \approx 2.2 \times f_{1}$.

Duty cycle in normal flashing mode: 50\%
Duty cycle in lamp outage mode: $40 \%$ (bright phase)

### 3.5 Pin 6, Supply Voltage, Sense

For accurate monitoring via the shunt resistor, a minimized layer resistance from point $\mathrm{V}_{\mathrm{S}}$ /shunt to pin 6 is recommended.

### 3.6 Pin 7, Lamp Outage Detection

### 3.6.1 Control Signal Threshold 1 (49-mV Comparator K1)

The detection point for lamp failure can be calculated from the control signal threshold, typically 49 mV with $\mathrm{V}_{\mathrm{S}}=12 \mathrm{~V}$. With a measuring resistance of $\mathrm{R}_{3}=18 \mathrm{~m} \Omega$, the frequency change-over is reached at a lamp load of $21 \mathrm{~W}+11.4 \mathrm{~W}$. The variation of the control signal threshold supply voltage takes into account the PTC characteristic of filament lamps.

### 3.6.2 Control Signal Threshold 2 ( 8 -mV Comparator K4)

A voltage drop between 49 mV to 8 mV at $\mathrm{R}_{3}$ shunt resistor lets the flasher work in frequency doubling mode.

If the voltage drop decreases to a value below $\mathrm{V}_{\text {RЗМАХ }}=8 \mathrm{mV}$, frequency doubling is disabled. This can be achieved either with a switch which bypasses the shunt resistor (for example, a special hazard warning switch) or with a small lamp load.

The arrangement of the supply connections to pins 2 and 6 must ensure that, on the connection PCB, the layer resistance from $\mathrm{V}_{\mathrm{S}}$ to pin 6 is lower than the resistance to pin 2.
Flasher operation starts with a lamp load of $P_{L} \geq 1 \mathrm{~W}$.

### 3.7 Pin 8, Start Input

Start condition for flashing: the voltage at pin 8 has to be below the K3 threshold (flasher switch closed).

Humidity and dirt may decrease the resistance between 49a and GND. If this leakage resistance is $>5 \mathrm{k} \Omega$, the IC is still kept in its off condition. In this case the voltage at pin 8 is between the thresholds of comparators K2 and K3.

During the bright phase the voltage at pin 8 is above the K2 threshold; during the dark phase it is below the K3 threshold.

For proper start conditions, a minimum lamp wattage of 1 W is required.

## 4. Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
