## 16-Bit Transceivers and Registers with 3-STATE Outputs

### General Description

The ABT16646 consists of bus transceiver circuits with 3-STATE, D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or from the internal registers. Data on the A or B bus will be clocked into the registers as the appropriate clock pin goes to a high logic level. Control  $\overline{OE}$  and direction pins are provided to control the transceiver function. In the transceiver mode, data present at the high impedance port may be stored in either the A or the B register or in both. The select controls can multiplex stored and real-time (transparent mode) data. The direction control determines which bus will receive data when the enable control  $\overline{OE}$  is Active LOW. In the isolation mode (control  $\overline{OE}$  HIGH), A data may be stored in the B register and/or B data may be stored in the A register.

### Features

- Independent registers for A and B buses
- Multiplexed real-time and stored data
- A and B output sink capability of 64 mA, source capability of 32 mA
- Guaranteed latchup protection
- High impedance glitch free bus loading during entire power up and power down cycle
- Nondestructive hot insertion capability

### Ordering Code:

| Order Number   | Package Number | Package Description                                                         |
|----------------|----------------|-----------------------------------------------------------------------------|
| 74ABT16646CSSC | MS56A          | 56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300" Wide      |
| 74ABT16646CMTD | MTD56          | 56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide |

Devices also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

| L                 | L                | X                 | ↗                 | X                | H                |                   |                  | Clock Bn into B Register and Output to An      |

H = HIGH Voltage Level  
 L = LOW Voltage Level  
 X = Immaterial  
 ↗ = LOW-to-HIGH Transition

**Note 1:** The data output functions may be enabled or disabled by various signals at the  $\overline{OE}$  and DIR inputs. Data input functions are always enabled; i.e., data at the bus pins will be stored on every LOW-to-HIGH transition of the appropriate clock inputs. Also applies to data I/O (A and B: 8-15) and #2 control pins.

| in the HIGH State                                                     | -0.5V to V <sub>CC</sub>             |
| Current Applied to Output<br>in LOW State (Max)                       | twice the rated I <sub>OL</sub> (mA) |
| DC Latchup Source Current                                             | -500 mA                              |
| Over Voltage Latchup (I/O)                                            | 10V                                  |

**Recommended Operating Conditions**

|                                                 |                |
|-------------------------------------------------|----------------|
| Free Air Ambient Temperature                    | -40°C to +85°C |
| Supply Voltage                                  | +4.5V to +5.5V |
| Minimum Input Edge Rate ( $\Delta V/\Delta t$ ) |                |
| Data Input                                      | 50 mV/ns       |
| Enable Input                                    | 20 mV/ns       |
| Clock Input                                     | 100 mV/ns      |

**Note 2:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 3:** Either voltage limit or current limit is sufficient to protect inputs.

**Note 9:** This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).

**Note 10:** This specification is guaranteed but not tested. The limits represent propagation delay with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

**Note 11:** This specification is guaranteed but not tested. The limits represent propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.) with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.

**Note 12:** The 3-STATE delays are dominated by the RC network (500 $\Omega$ , 250 pF) on the output and has been excluded from the datasheet.

| <p><b>Note 13:</b> This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).</p> <p><b>Note 14:</b> This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.</p> <p><b>Note 15:</b> Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH to LOW (<math>t_{OSHL}</math>), LOW to HIGH (<math>t_{OSLH}</math>), or any combination switching LOW to HIGH and/or HIGH to LOW (<math>t_{OST}</math>). This specification is guaranteed but not tested.</p> <p><b>Note 16:</b> This describes the difference between the delay of the LOW-to-HIGH and the HIGH-to-LOW transition on the same pin. It is measured across all the outputs (drivers) on the same chip, the worst (largest delta) number is the guaranteed specification. This specification is guaranteed but not tested.</p> <p><b>Note 17:</b> Propagation delay variation for a given set of conditions (i.e., temperature and <math>V_{CC}</math>) from device to device. This specification is guaranteed but not tested.</p> |                                            |                                                                                                                                                   |                                                                                                                                                    |                                        |

Fairchild does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and Fairchild reserves the right at any time without notice to change said circuitry and specifications.

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
