## 74ABT16652

# 16-Bit Transceivers and Registers with 3-STATE Outputs

#### **General Description**

The ABT16652 consists of sixteen bus transceiver circuits with D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or from the internal registers. Each byte has separate control inputs which can be shorted together for full 16-bit operation. Data on the A or B bus will be clocked into the registers as the appropriate clock pin goes to HIGH logic level. Output Enable pins (OEAB,  $\overline{\text{OEBA}}$ ) are provided to control the transceiver function.

#### **Features**

- Independent registers for A and B buses
- Multiplexed real-time and stored data
- Separate control logic for each byte
- A and B output sink capability of 64 mA, source capability of 32 mA
- Guaranteed output skew
- High impedance glitch free bus loading during entire power up and power down cycle
- Nondestructive hot insertion capability

#### **Ordering Code:**

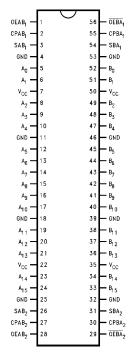

Order Number	Package Number	Package Description
74ABT16652CSSC	MS56A	56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300" Wide
74ABT16652CMTD	MTD56	56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

## **Connection Diagram**

### **Functional Description**

In the transceiver mode, data present at the HIGH impedance port may be stored in either the A or B register or

The select (SAB<sub>n</sub>, SBA<sub>n</sub>) controls can multiplex stored and

The examples in Figure 1 demonstrate the four fundamental bus-management functions that can be performed with the ABT16652.

Data on the A or B data bus, or both can be stored in the internal D flip-flop by LOW to HIGH transitions at the appropriate Clock Inputs (CPAB<sub>n</sub>, CPBA<sub>n</sub>) regardless of the Select or Output Enable Inputs. When SAB and SBA are in the real time transfer mode, it is also possible to store data without using the internal D flip-flops by simultaneously enabling  $OEAB_n$  and  $\overline{OEBA}_n$ . In this configuration each Output reinforces its Input. Thus when all other data sources to the two sets of bus lines are in a HIGH impedance state, each set of bus lines will remain at its last state.

- H = HIGH Voltage Level L = LOW Voltage Level

- X = Immaterial

  ✓ = LOW to HIGH Clock Transition

Note 1: The data output functions may be enabled or disabled by various signals at OEAB or OEBA inputs. Data input functions are always enabled, i.e., data at the bus pins will be stored on every LOW to HIGH transition on the clock inputs. This also applies to data I/O (A and B: 8–15) and #2 control pins.

Note 8: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).

Note 9: This specification is guaranteed but not tested. The limits represent propagation delay with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load. This specification pertains to single output switching only.

Note 10: This specification is guaranteed but not tested. The limits represent propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.) with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.

Note 11: The 3-STATE delay times are dominated by the RC network (5000, 250 pF) on the output and has been excluded from the datasheet.

Note 12: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase (i.e., all LOW-to-HIGH, HIGH-to-LOW, etc.).

Note 13: This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors in the standard AC load.

Note 14: Skew is defined as the absolute value of the difference between the actual propagation delays for any two separate outputs of the same device. The specification applies to any outputs switching HIGH to LOW (t<sub>OSHL</sub>), LOW to HIGH (t<sub>OSLH</sub>), or any combination switching LOW to HIGH and/or HIGH to LOW (t<sub>OST</sub>). This specification is guaranteed but not tested.

Note 15: This describes the difference between the delay of the LOW-to-HIGH and the HIGH-to-LOW transition on the same pin. It is measured across all the outputs (drivers) on the same chip, the worst (largest delta) number is the guaranteed specification. This specification is guaranteed but not tested.

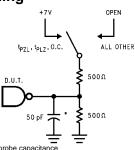

Note 16: Propagation delay variation for a given set of conditions (i.e., temperature and V<sub>CC</sub>) from device to device. This specification is guaranteed but not tested.
