## Functional Description

The AC/ACT163 counts in modulo-16 binary sequence. From state 15 (HHHH) it increments to state 0 (LLLL). The clock inputs of all flip-flops are driven in parallel through a clock buffer. Thus all changes of the Q outputs occur as a result of, and synchronous with, the LOW-to-HIGH transition of the CP input signal. The circuits have four fundamental modes of operation, in order of precedence synchronous reset, parallel load, count-up and hold. Four control inputs-Synchronous Reset (SR), Parallel Enable $(\overline{\mathrm{PE}})$, Count Enable Parallel (CEP) and Count Enable Trickle (CET)-determine the mode of operation, as shown in the Mode Select Table. A LOW signal on SR overrides counting and parallel loading and allows all outputs to go LOW on the next rising edge of CP. A LOW signal on PE overrides counting and allows information on the Parallel Data $\left(P_{n}\right)$ inputs to be loaded into the flip-flops on the next rising edge of CP. With $\overline{\mathrm{PE}}$ and $\overline{\mathrm{SR}}$ HIGH, CEP and CET permit counting when both are HIGH. Conversely, a LOW signal on either CEP or CET inhibits counting.
The AC/ACT163 uses D-type edge-triggered flip-flops and changing the $\mathrm{SR}, \mathrm{PE}, \mathrm{CEP}$ and CET inputs when the CP is in either state does not cause errors, provided that the recommended setup and hold times, with respect to the rising edge of CP, are observed.
The Terminal Count (TC) output is HIGH when CET is HIGH and counter is in state 15 . To implement synchronous multistage counters, the TC outputs can be used with the CEP and CET inputs in two different ways.
Figure 1 shows the connections for simple ripple carry, in which the clock period must be longer than the CP to TC delay of the first stage, plus the cumulative CET to TC delays of the intermediate stages, plus the $\overline{\mathrm{CET}}$ to CP setup time of the last stage. This total delay plus setup time sets the upper limit on clock frequency. For faster clock rates, the carry lookahead connections shown in Figure 2 are recommended. In this scheme the ripple delay through the intermediate stages commences with the same clock that causes the first stage to tick over from max to min in the Up mode, or min to max in the Down mode, to start its final cycle. Since this final cycle takes 16 clocks to complete, there is plenty of time for the ripple to progress through the intermediate stages. The critical timing that limits the clock period is the CP to $\overline{T C}$ delay of the first stage plus the CEP to CP setup time of the last stage. The TC output is subject to decoding spikes due to internal race conditions and is therefore not recommended for use as a clock or asynchronous reset for flip-flops, registers or counters.
Logic Equations: Count Enable $=\mathrm{CEP} \cdot \mathrm{CET} \cdot \overline{\mathrm{PE}}$

$$
\mathrm{TC}=\mathrm{Q}_{0} \cdot \mathrm{Q}_{1} \cdot \mathrm{Q}_{2} \cdot \mathrm{Q}_{3} \cdot \mathrm{CET}
$$

## State Diagram

| Absolute Maximum Ratings（Note 1） |  |
| :---: | :---: |
| Supply Voltage（ $\mathrm{V}_{\mathrm{CC}}$ ） | -0.5 V to +7.0 V |
| DC Input Diode Current（ $\mathrm{I}_{1 \mathrm{~K}}$ ） |  |
| $V_{1}=-0.5 \mathrm{~V}$ | －20 mA |
| $V_{1}=V_{C C}+0.5 \mathrm{~V}$ | ＋20 mA |
| DC Input Voltage（ $\mathrm{V}_{\mathrm{l}}$ ） | -0.5 V to $\mathrm{V}_{C C}+0.5 \mathrm{~V}$ |
| DC Output Diode Current（ $\mathrm{IOK}^{\text {）}}$ |  |
| $\mathrm{V}_{\mathrm{O}}=-0.5 \mathrm{~V}$ | －20 mA |
| $\mathrm{V}_{\mathrm{O}}=\mathrm{V}_{\mathrm{CC}}+0.5 \mathrm{~V}$ | ＋20 mA |
| DC Output Voltage（ $\mathrm{V}_{\mathrm{O}}$ ） | -0.5 V to $\mathrm{V}_{\mathrm{CC}}+0.5 \mathrm{~V}$ |
| DC Output Source or Sink Current（ $\mathrm{I}_{\mathrm{O}}$ ） | $\pm 50 \mathrm{~mA}$ |
| DC $\mathrm{V}_{\mathrm{CC}}$ or Ground Current per Output Pin（I $\mathrm{I}_{\mathrm{CC}}$ or $\mathrm{I}_{\mathrm{GND}}$ ） | $\pm 50 \mathrm{~mA}$ |
| Storage Temperature（ $\mathrm{T}_{\text {STG }}$ ） | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ | Junction Temperature（ $\mathrm{T}_{\mathrm{J}}$ ）

$-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$

PDIP
$140^{\circ} \mathrm{C}$ Note 1：Absolute maximum ratings are those values beyond which damage to the device may occur．The databook specifications should be met，with out exception，to ensure that the system design is reliable over its power supply，temperature，and output／input loading variables．Fairchild does not recommend operation of circuits outside databook specifications
