## Functional Description

The Transmit/Receive (T/ $\bar{R}$ ) input determines the direction of the data flow through the bidirectional transceivers. Transmit (active HIGH) enables data from the A Port to the B Port; Receive (active LOW) enables data from the B Port to the A Port.

The Output Enable ( $\overline{OE}$ ) input disables the parity and ERROR outputs and both the A and B Ports by placing them in a HIGH-Z condition when the Output Enable input is HIGH.

When transmitting (T/ $\bar{R}$  HIGH), the parity generator detects whether an even or odd number of bits on the A Port are HIGH and compares these with the condition of the parity

select ( $\overline{ODD/EVEN}$ ). If the Parity Select is HIGH and an even number of A inputs are HIGH, the Parity output is HIGH.

In receiving mode (T/ $\bar{R}$  LOW), the parity select and number of HIGH inputs on port B are compared to the condition of the Parity input. If an even number of bits on the B Port are HIGH, the parity select is HIGH, and the PARITY input is HIGH, then  $\overline{ERROR}$  will be HIGH to indicate no error. If an odd number of bits on the B Port are HIGH, the parity select is HIGH, and the PARITY input is HIGH, the  $\overline{ERROR}$  will be LOW indicating an error.

**Absolute Maximum Ratings** (Note 1)

Storage Temperature	-65°C to +150°C
Ambient Temperature under Bias	-55°C to +125°C
Junction Temperature under Bias	-55°C to +150°C
V <sub>CC</sub> Pin Potential to Ground Pin	-0.5V to +7.0V
Input Voltage (Note 2)	-0.5V to +7.0V
Input Current (Note 2)	-30 mA to +5.0 mA
Voltage Applied to Output in HIGH State (with V <sub>CC</sub> = 0V)	
Standard Output	-0.5V to V <sub>CC</sub>
3-STATE Output	-0.5V to +5.5V
Current Applied to Output in LOW State (Max)	twice the rated I <sub>OL</sub> (mA)

**Recommended Operating Conditions**

Free Air Ambient Temperature	0°C to +70°C
Supply Voltage	+4.5V to +5.5V

**Note 1:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 2:** Either voltage limit or current limit is sufficient to protect inputs.

**Note 3:** These delay times reflect the 3-STATE recovery time only and not the signal time through the buffers or the parity check circuitry. To assure VALID information at the ERROR pin, time must be allowed for the signal to propagate through the drivers (B to A), through the parity check circuitry (same as A to PARITY), and to the ERROR output after the ERROR pin has been enabled (Output Enable times). VALID data at the ERROR pin  $\geq$  (A to PARITY) + (Output Enable Time).
