# 74LVT162240 • 74LVTH162240 Low Voltage 16-Bit Inverting Buffer/Line Driver with 3-STATE Outputs and 25Ω Series Resistors in the Outputs

### **General Description**

FAIRCHILD

SEMICONDUCTOR TM

The LVT162240 and LVTH162240 contain sixteen inverting buffers with 3-STATE outputs designed to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is nibble controlled. Individual 3-STATE control inputs can be shorted together for 8-bit or 16-bit operation.

The LVT162240 and LVTH162240 are designed with equivalent  $25\Omega$  series resistance in both the HIGH and LOW states of the output. This design reduces line noise in applications such as memory address drivers, clock drivers, and bus transceivers/transmitters.

The LVTH162240 data inputs include bushold, eliminating the need for external pull-up resistors to hold unused inputs.

These inverting buffers and line drivers are designed for low-voltage (3.3V)  $V_{\rm CC}$  applications, but with the capability to provide a TTL interface to a 5V environment. The LVT162240 and LVTH162240 are fabricated with an advanced BiCMOS technology to achieve high speed operation similar to 5V ABT while maintaining a low power dissipation.

#### Features

- $\blacksquare$  Input and output interface capability to systems at 5V V\_{CC}
- Outputs include equivalent series resistance of 25Ω to make external termination resistors unnecessary and reduce overshoot and undershoot
- Bushold data inputs eliminate the need for external pull-up resistors to hold unused inputs (74LVTH162240), also available without bushold feature (74LVT162240)
- Live insertion/extraction permitted
- Power Up/Down high impedance provides glitch-free bus loading
- Functionally compatible with the 74 series 162240
- Latch-up performance exceeds 500 mA
- ESD performance: Human-body model > 2000V Machine model > 200V Charged-device model > 1000V

3-STATE outputs are controlled by an Output Enable  $(\overline{\text{OE}}_n)$ 

input for each nibble. When  $\overline{\text{OE}}_n$  is LOW, the outputs are in

2-state mode. When  $\overline{\text{OE}}_n$  is HIGH, the outputs are in the

high impedance mode, but this does not interfere with

### **Functional Description**

The LVT162240 and LVTH162240 contain sixteen inverting buffers with 3-STATE standard outputs. The device is nibble (4 bits) controlled with each nibble functioning identically, but independent of the other. The control pins may be shorted together to obtain full 16-bit operation. The

I <sub>CCZ+</sub>	Power Supply Current	3.6			0.19		$V_{CC} \le V_0 \le 5.5V$ , Outputs Disabled
$\Delta I_{CC}$	Increase in Power Supply Current (Note 9)	3.6			0.2	mA	One Input at $V_{CC} - 0.6V$ Other Inputs at $V_{CC}$ or GND

Note 5: All typical values are at  $V_{CC} = 3.3V$ ,  $T_A = 25^{\circ}C$ . Note 6: Applies to bushold versions only (74LVTH162240).

**Note 7:** An external driver must source at least the specified current to switch from LOW-to-HIGH.

Note 8: An external driver must sink at least the specified current to switch from HIGH-to-LOW.

Note 9: This is the increase in supply current for each input that is at the specified voltage level rather than  $V_{CC}$  or GND.
