

CD4094BC 8-Bit Shift Register/Latch with 3-STATE Outputs

General Description

The CD4094BC consists of an 8-bit shift register and a 3-STATE 8-bit latch. Data is shifted serially through the shift register on the positive transition of the clock. The output of the last stage (Q_8) can be used to cascade several devices. Data on the Q_8 output is transferred to a second output, Q'_8 , on the following negative clock edge.

The output of each stage of the shift register feeds a latch, which latches data on the negative edge of the STROBE input. When STROBE is HIGH, data propagates through the latch to 3-STATE output gates. These gates are enabled when OUTPUT ENABLE is taken HIGH.

Features

- Wide supply voltage range: 3.0V to 18V
- High noise immunity: $0.45 V_{DD}$ (typ.)
- Low power TTL compatibility:
 - Fan out of 2 driving 74L or 1 driving 74LS
- 3-STATE outputs
