## AC Electrical Characteristics

| $\begin{aligned} & \hline \mathrm{t}_{\mathrm{PLH}}, \\ & \mathrm{t}_{\mathrm{PHL}} \end{aligned}$ | Data Propagation Delay $A_{n}$ to $C_{n}, D_{n}$ or $B_{n}$ to $D_{n}, C_{n}$ (Note 7) | 4.75 |  |  | 0.25 | ns |

| $\begin{aligned} & \mathrm{t}_{\mathrm{PLZ}}, \\ & \mathrm{t}_{\mathrm{PH}} \end{aligned}$ | Switch Disable Time $\overline{B E}$ to $A_{n}, B_{n}, C_{n}$, or $D_{n}$ | 4.75 | 1.5 |  | 5.5 | ns |

Note 7: This parameter is guaranteed by design but not tested. The bus switch contributes no propagation delay other than the RC delay of the On resistance of the switch and the load capacitance. The time constant for the switch and alone is of the order of 0.25 ns for 50 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
